Transplant Rejection and Tolerance: Advancing the Field through Integration of Computational and Experimental Investigations Giorgio Raimondi, Kathryn J. Wood, Alan S. Perelson, Julia C. Arciero, 2017-12-15

Organ transplantation is a life saving surgical procedure through which the functionality of a failing organ system can be restored However without the life long administration of immunosuppressive drugs the recipient s immune system will launch a massive immune attack that will ultimately destroy the graft Although successful at protecting the graft from an immune attack long term use of immunosuppressive drugs leads to serious complications e g increased risk of infection diabetes hypertension cardiovascular disease and cancer Moreover recipients suffer from limited long term graft survival rates due to the inability of current treatments to establish tolerance to the transplanted tissues Thus there is a great medical need to understand the complex network of immune system interactions that lead to transplant rejection so that new strategies of intervention can be determined that will redirect the system toward transplant acceptance while preserving immune competence against offending agents In the past 20 years the discovery and growing understanding of the positive and negative regulators of the activation of the immune system have fostered new interventional procedures targeting one or the other While pre clinical results proved the validity of these strategies their clinical implementation has been troublesome These results underscore the need for additional methods to determine the most effective interventions to prevent long term transplant rejection New tools of genomics proteomics and metabolomics are being implemented in powerful analyses that promise the development of better safer personalized treatments In parallel theoretical modeling has emerged as a tool that transcends investigations of individual mechanistic processes and instead unravels the relevant mechanisms of complex systems such as the immune response triggered by a transplant In this way theoretical models can be used to identify important behavior that arises from complex systems and thereby delineate emergent properties of biological systems that could not be identified studying single components Employing this approach interdisciplinary collaborations among immunologists mathematicians and system biologists will yield novel perspectives in the development of more effective strategies of intervention The aim of this Research Topic is to demonstrate how new insight and methods from theoretical and experimental studies of the immune response can aid in identifying new research directions in transplant immunology

First techniques from various theoretical and experimental studies with applications to the immune response will be reviewed to determine how they can be adapted to explore the complexity of transplant rejection Second recent advances in the acquisition and mining of large data sets related to transplant genomics proteomics and metabolomics will be discussed in the context of their predictive power and potential for optimizing and personalizing patient treatment Last new perspectives will be offered on the integration of computational immune modeling with transplant and omics data to establish more effective strategies of intervention that promote transplant tolerance

The Evolution of Rhythm Cognition: Timing in Music and Speech Andrea Ravignani, Henkjan Honing, Sonja A. Kotz, 2018-07-24 Human speech and music share a number of similarities and differences One of the closest similarities is their temporal nature as both i develop over time ii form sequences of temporal intervals possibly differing in duration and acoustical marking by different spectral properties which are perceived as a rhythm and iii generate metrical expectations Human brains are particularly efficient in perceiving producing and processing fine rhythmic information in music and speech However a number of critical questions remain to be answered Where does this human sensitivity for rhythm arise How did rhythm cognition develop in human evolution How did environmental rhythms affect the evolution of brain rhythms Which rhythm specific neural circuits are shared between speech and music or even with other domains Evolutionary processes long time scales often prevent direct observation understanding the psychology of rhythm and its evolution requires a close fitting integration of different perspectives First empirical observations of music and speech in the field are contrasted and generate testable hypotheses Experiments exploring linguistic and musical rhythm are performed across sensory modalities ages and animal species to address questions about domain specificity development and an evolutionary path of rhythm Finally experimental insights are integrated via synthetic modeling generating testable predictions about brain oscillations underlying rhythm cognition and its evolution Our understanding of the cognitive neurobiological and evolutionary bases of rhythm is rapidly increasing However researchers in different fields often work on parallel potentially converging strands with little mutual awareness This research topic builds a bridge across several disciplines focusing on the cognitive neuroscience of rhythm as an evolutionary process It includes contributions encompassing although not limited to 1 developmental and comparative studies of rhythm e g critical acquisition periods innateness 2 evidence of rhythmic behavior in other species both spontaneous and in controlled experiments 3 comparisons of rhythm processing in music and speech e g behavioral experiments systems neuroscience perspectives on music speech networks 4 evidence on rhythm processing across modalities and domains 5 studies on rhythm in interaction and context social affective etc 6 mathematical and computational e g connectionist symbolic models of rhythmicity as an evolved behavior

Hybrid Solutions for the Modelling of Complex Environmental Systems Christian E. Vincenot, Stefano Mazzoleni, Lael Parrott, 2017-01-11 Systems studied in environmental science due to their structure and the heterogeneity of the entities composing them often exhibit complex

dynamics that can only be captured by hybrid modeling approaches While several concurrent definitions of hybrid modeling can be found in the literature it is defined here broadly as the approach consisting in coupling existing modelling paradigms to achieve a more accurate or efficient representation of systems The need for hybrid models generally arises from the necessity to overcome the limitation of a single modeling technique in terms of structural flexibility capabilities or computational efficiency This book brings together experts in the field of hybrid modelling to demonstrate how this approach can address the challenge of representing the complexity of natural systems Chapters cover applied examples as well as modeling methodology **Quantifying Uncertainty in Subsurface Systems** Céline Scheidt,Lewis Li,Jef Caers,2018-06-19

Under the Earth s surface is a rich array of geological resources many with potential use to humankind However extracting and harnessing them comes with enormous uncertainties high costs and considerable risks The valuation of subsurface resources involves assessing discordant factors to produce a decision model that is functional and sustainable This volume provides real world examples relating to oilfields geothermal systems contaminated sites and aquifer recharge Volume highlights include A multi disciplinary treatment of uncertainty quantification Case studies with actual data that will appeal to methodology developers A Bayesian evidential learning framework that reduces computation and modeling time
