*Iterated Maps on the Interval as Dynamical Systems*

Pierre Collet,J.-P. Eckmann,2009-08-25 Iterations of continuous maps of an interval to itself serve as the simplest examples of models for dynamical systems These models present an interesting mathematical structure going far beyond the simple equilibrium solutions one might expect If in addition the dynamical system depends on an experimentally controllable parameter there is a corresponding mathematical structure revealing a great deal about interrelations between the behavior for different parameter values This work explains some of the early results of this theory to mathematicians and theoretical physicists with the additional hope of stimulating experimentalists to look for more of these general phenomena of beautiful regularity which oftentimes seem to appear near the much less understood chaotic systems Although continuous maps of an interval to itself seem to have been first introduced to model biological systems they can be found as models in most natural sciences as well as economics Iterated Maps on the Interval as Dynamical Systems is a classic reference used widely by researchers and graduate students in mathematics and physics opening up some new perspectives on the study of dynamical systems

*Spontaneous Formation of Space-Time Structures and Criticality* T. Riste,David Sherrington,2012-12-06 This volume contains the

proceedings of a NATO Advanced study Institute held at Geilo Norway between 2 12 april 1991 This institute was the eleventh in a series held biannually at Geilo on the subject of phase transitions It was intended to capture the latest ideas on selforganized patterns and criticality The Institute brought together many lecturers students and active researchers in the field from a wide range of NATO and non NATO countries The main financial support came from the NATO scientific Affairs Division but additional support was obtained from the Norwegian Research Council for Science and the Humanities NAVF and Institutt for energi teknikk The organizers would like to thank all these contributors for their help in promoting an exciting and rewarding meeting and in doing so are confident that they echo the appreciation of all the participants In cooperative equilibrium systems physical states are described by spatio temporal correlation functions The intimate connection between space and time correlations is especially apparent at the critical point the second order phase transition where the spatial range and the decay time of the correlation function both become infinite The salient features of critical phenomena and the history of the development of this field of science are treated in the first chapter of this book

Solutions Manual includes solutions to the odd numbered exercises featured in the third edition of Steven Strogatz's classic text *Nonlinear Dynamics and Chaos With Applications to Physics Biology Chemistry and Engineering* The textbook and accompanying Student Solutions Manual are aimed at newcomers to nonlinear dynamics and chaos especially students taking a first course in the subject Complete with graphs and worked out solutions this manual demonstrates techniques for students to analyze differential equations bifurcations chaos fractals and other subjects Strogatz explores in his popular book

Christophe Sabot,2003 In this text the author considers discrete Laplace operators defined on lattices based on finitely  
ramified self similar sets and their continuous analogs defined on the self similar sets He focuses on the spectral properties  
of these operators The basic example is the lattice based on the Sierpinski gasket He introduces a new renormalization map  
that appears to be a rational map defined on a smooth projective variety More precisely this variety is isomorphic to a  
product of three types of Grassmannians complex Grassmannians Lagrangian Grassmannian and orthogonal Grassmannians  
He relates some characteristics of the dynamics of its iterates with some characteristics of the spectrum of the operator  
Specifically he gives an explicit formula for the density of states in terms of the Green current of the map and he relates the  
indeterminacy points of the map with the so called Neumann Dirichlet eigenvalues which lead to eigenfunctions with  
compact support on the unbounded lattice Depending on the asymptotic degree of the map he can prove drastically different  
spectral properties of the operators The formalism is valid for the general class of finitely ramified self similar sets
