**Lightweight Electric/Hybrid Vehicle Design** John Fenton,Ron Hodkinson,2001-07-04 Lightweight Electric Hybrid Vehicle Design covers the particular automotive design approach required for hybrid electrical drive vehicles There is currently huge investment world wide in electric vehicle propulsion driven by concern for pollution control and depleting oil resources The radically different design demands of these new vehicles requires a completely new approach that is covered comprehensively in this book The book explores the rather dramatic departures in structural configuration necessary for purpose designed electric vehicle including weight removal in the mechanical systems It also provides a comprehensive review of the design process in the electric hybrid drive and energy storage systems Ideal for automotive engineering students and professionals Lightweight Electric Hybrid Vehicle Design provides a complete introduction to this important new sector of the industry Comprehensive coverage of all design aspects of electric hybrid cars in a single volume Packed with case studies and applications In depth treatment written in a text book style rather than a theoretical specialist text style     **Empirical Evaluation of Renewable Energy Projects for Sustainable Development** Tony Kealy,2024-08-22

This book critically analyses renewable energy sources of electrical power energy utilised to save money on the amount of electrical energy imported from the national electricity grid and help nations meet binding environmental goals. The main renewable energy sources analysed are wind turbine generators, hydroelectric plant and solar PV systems. The book presents a robust evaluation framework that can be used in the renewable energy analysis process. One of the main findings is the identification of short term variations associated mainly with wind turbine electrical generator power output signals. These short term variations are negating the potential advantages of installing wind turbine electrical generators. One of the suggested methods to counteract the short term variations is the use of energy storage. Without utility sized energy storage, binding energy targets will be very difficult to achieve. The three main realms of sustainable development, namely environmental, economic and human realms are discussed throughout the book. The three realms are closely interlinked so a weakness identified in any one realm affects the overall sustainability of the business, country, any organisation development process.

**Self-excited and Self-regulated Synchronous Generating System for Wind and Hydro Generators** Izzat, Likaa Fahmi  
Ahmed,2013-01-01 In this work a developed model of brushless synchronous generator of wound rotor type is designed  
analyzed by FEM practically applied and investigated A comparison of results with conventional machines is also performed  
The presented machine can be applied for multi pole wind hydro generators or double poles diesel engine generators It is self  
excited by residual magnetism and a connected capacitor It is also self regulated by making use of fluctuations at load or  
limited speed changes The generated voltage may last at extended speed range by arranging a generating system with  
variable capacitance By eliminating the permanent magnets or advanced manufacturing technology of rotor poles and  
without using extra rotating external DC excitors an efficient excitation field and an output of flat self compensated  
compound characteristic are obtained More the feature of damper windings is determined Concerning the fact of  
environmental diminishing of elements in materials of permanent magnets and D C Battery the presented novel machine is  
hence a good alternative and more economic from generators exist in the market Beside it is safer and highly recommended  
for power stability when connected to the grid
