The Growing Edge, 2006 **Enhancement of Photosynthesis through Light Utilization in Plants**

and Crops Jose R. Peralta-Videa, Sina Fallah, Meijian Yang, 2025-06-02 Oxygenic photosynthesis in plants initiates when the pigments such as chlorophyll and carotenoids harvest light and transfer the energy toward reaction centers where it is converted to chemical energy via photochemical charge separation. Most importantly, plants effectively use the light energy and convert carbon dioxide and water into carbohydrates and oxygen, sustaining the lives on Earth. Although light energy is vital for the photosynthesis process, excessive light intensity can cause photoinhibition in plants, reducing photochemical efficiency and also can cause photooxidative system damage. On the other hand, low light intensity could also negatively affect photosynthesis, which therefore can severely restrict plant growth and development. Under such circumstances of different light intensities, plants also have various adaptive strategies to reduce the potential damages caused by light stress. Therefore, this Research Topic welcomes collections on the evolving and adapting strategies in plants in order to efficiently utilize light energy under light stresses and sustain plant growth.

Biostimulants in Agriculture II: Towards a Sustainable Future

Maurizio Ruzzi, Giuseppe Colla, Youssef Roupheal, 2024-06-11 Modern agriculture needs to review and broaden its practices and business models by integrating opportunities coming from different adjacent sectors and value chains, including the bio-based industry in a fully circular economy strategy. Searching for new tools and technologies to increase crop productivity under optimal and sub-optimal conditions and to improve resources use efficiency is crucial to ensure food security while preserving soil quality, microbial biodiversity, and providing business opportunities for farmers. Biostimulants based on microorganisms or organic substances obtained from renewable materials represent a sustainable, efficient technology or complement to synthetic counterparts to improve nutrient use efficiency and secure crop yield stability. Under the new European Union Regulation 2019/1009, plant biostimulants were defined based on four agricultural functional claims as follows: 1) Plant biostimulants are products that stimulate plant nutrition processes independently of the product's nutrient content with the sole aim of improving one or more of the following characteristics of the plant and/or the plant rhizosphere: 1) nutrient use efficiency, 2) tolerance/resistance to a biotic stress, 3) quality characteristics, or 4) availability of confined nutrients in the soil or rhizosphere. Many diverse natural substances and chemical derivatives of natural or synthetic compounds, as well as beneficial microorganisms, are cataloged as plant biostimulants, including: i) humic substances, ii) plant or animal-based protein hydrolysates, iii) macro and micro-algal extracts, iv) silicon, v) arbuscular mycorrhizal fungi (AMF), and vi) plant growth promoting rhizobacteria (PGPR) belonging to the *Azotobacter*, *Azospirillum*, and *Rhizobium* genera.
