How to Make a Lava Lamp

What Happened

A lava lamp uses buoyancy and the different scientific principles, density and polarity.

Buoyancy is the measurement of how something floats in a liquid. Buoyancy is a science concept of force.

Oil molecules are special molecules of oil and water. You'll find that the water is heavier than the oil. Water is heavier which will cause it to be at the bottom of oil. Oil being heavier can sink and when when sinking together water molecules will "push" because they have a negative electrical charge. When water sinks, it's like

oil molecules, however, are more charged. They have a positive charge. So when the water molecules are sinking, molecules will be pulled up to follow a light molecule. When the water goes up and when the oil goes down. The water sinks because it has a negative charge. The oil molecules are positive, therefore they are pulled up by the water. The water sinks because it has a negative charge. The oil molecules are positive, therefore they are pulled up by the water.
