Architectures for Adaptive Software Systems Raffaella Mirandola, Ian Gorton, Christine Hofmeister, 2009-06-08 Much of a software architect's life is spent designing software systems to meet a set of quality requirements. General software quality attributes include scalability, security, performance, or reliability. Quality attribute requirements are part of an application's non-functional requirements which capture the many facets of how the functional requirements of an application are achieved. Understanding modeling and continually evaluating quality attributes throughout a project lifecycle are all complex engineering tasks which continue to challenge the software engineering scientific community. While we search for improved approaches, methods, formalisms, and tools that are usable in practice and can scale to large systems, the complexity of the applications that the software industry is challenged to build is ever increasing. Thus, as a research community, there is little opportunity for us to rest on our laurels as our innovations that address new aspects of system complexity must be deployed and validated. To this end, the 5th International Conference on the Quality of

Software Architectures QoSA 2009 focused on architectures for adaptive software systems Modern software systems must often reconfigure their structure and behavior to respond to continuous changes in requirements and in their execution environment In these settings quality models are helpful at an architectural level to guide systematic model driven software development strategies by evaluating the impact of competing architectural choices *Industrial Robotics* ,2004
