

Optics - The Study of Light

Refraction

Light refracts when passing between two substances at an angle.

Light does not bend as glass that is not yet within water. Bending begins at boundary between air and water.

SLAB

Light travels in a straight line through uniform medium. Refraction occurs at light's boundary with another medium.

The refractive index (n) of a substance is a ratio based on the speed of light.

SLAB

At the light boundary, the angle of incidence is equal to the angle of refraction.

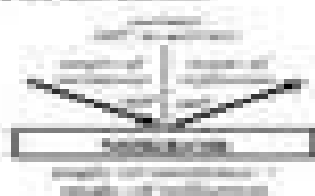

Reflection

Light reflects when it bounces off a surface.

Normal - an imaginary line that is perpendicular to a surface.

Angle of Incidence - the angle between the incident ray and the normal.

Angle of Reflection - the angle between the reflected ray and the normal.

Focus

Focus is the point where parallel rays of light converge after reflecting off a curved surface. Focus is the focal point of a lens.

Concave Mirror

Concave mirrors focus light rays that are parallel to the principal axis to a point called the focal point. Light rays that are not parallel to the principal axis focus at different points.

Convex Mirror

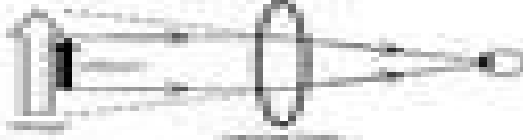

The convex mirror is curved outwards, away from the object. It always forms a virtual, upright, and reduced image.

The image is virtual, upright, and reduced in size. The image is always located behind the mirror.

Lens

Lenses work by refraction. Light rays passing through a lens are bent towards the normal.

A convex lens converges light.

A concave lens is diverging. The light rays never converge.

A concave lens diverges light.

A concave lens is diverging. The light rays spread apart.

Image is virtual and upright.

Concave and convex lenses depend on their shape. If a lens is thicker in the middle, it is a converging lens. If it is thinner in the middle, it is a diverging lens.

Concave Lens

Concave lenses are thinner in the middle and thicker at the edges. They diverge light rays.

Concave lenses are diverging. The light rays spread apart.

Optical System

Optical systems use lenses and mirrors to focus light. They can be used to create images, project light, or focus light on a target.

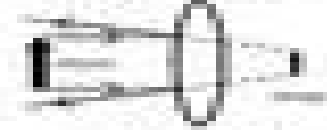

Optical systems are used in many applications, including cameras, telescopes, and microscopes.

Image

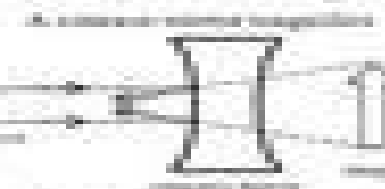

Images are formed by light rays that are reflected or refracted. The image is a representation of the object that is formed by the light rays.

The image is formed by the light rays that are reflected or refracted. The image is a representation of the object that is formed by the light rays.

A convex lens forms a real image.

A convex lens forms a virtual image.

A concave lens forms a virtual image. The image is always upright and reduced in size.
