

CURRENT ELECTRICITY

Introduction

Current electricity is the study of flow of charge through a conductor.

- A charge particle which flow can be positive or negative.
- A push called voltage is needed to enable the charge to flow. The charge move from high electric potential to low electric potential.
- For an electric current to flow, two things are necessary, a source and a closed path.

POTENTIAL DIFFERENCE AND ELECTROMOTIVE FORCE

Electric potential difference (pd) – is the work done per unit charge in moving electric charge from one point to another.

$$\text{potential difference} = \frac{\text{work done (W)}}{\text{charge moved (Q)}}$$

- The SI unit for Pd is **Volt**. One volt is equivalent to one joule per coulomb.
- Potential difference is measured by **Voltmeter**.
- The electromotive force Emf of a cell is potential difference across the terminal when there is no current flowing through it.
- Emf is not a force but a process whereby a device such as cell or generator convert chemical or mechanical energy into electrical energy.
- It can be thought of as an electrical potential energy that is converted into the kinetic energy of charge moving in on electric circuit.

Thus the cell provides an electromotive force which sets up (Pd) across various circuit components, there by driving current through them.

When a cell is connected to an external device such as lamp, electric current flow through the device and some electric energy is converted into other form like heat and light.

- The amount of converted energy per unit charge is the potential difference Pd across the device. The potential difference is also called a **voltage**.
- When several cells have been joined together they form a **battery**. This voltage cause the flow of charge (electron).
- Every cell has a voltage across the terminal. This voltage causes the flow of charge (electron) in a circuit. A dry cell has a voltage 1.5 V normally marked on a cell.
- Voltage is measured by using a voltmeter, and the SI unit of a voltage is VOLT (V).
- If 1 coulomb of charge given 1 Joule of potential difference energy, then the Pd across terminal of a battery is 1 volt.

Alternating-Current Electricity and Its Applications to Industry William Henry Timbie, 2013-09 This historic book may have numerous typos and missing text Purchasers can usually download a free scanned copy of the original book without typos from the publisher Not indexed Not illustrated 1916 edition Excerpt voltage between conductors in volts effective current along each conductor in amperes $\cos \theta$ power factor of the load Thus $1\,200\,000\sqrt{3} \times 11\,000 \times \cos \theta = 1\,200\,000 \times 1\,732 \times 11\,000 \times 0.8078$ amperes We now compute as in the case of a single phase line the total annual cost of the line when constructed of conductors of different sizes Starting with No 0 stranded copper conductor we find the cost of line as follows One mile of No 0 weighs 1730 lb A ten mile three wire system would weigh $30 \times 1730 = 51\,900$ lb At 20 cents per pound the line would cost $0.20 \times 51\,900 = 10\,380$ Annual fixed charges at 8.5 per cent would amount to $10\,380 \times 0.085 = 882$ The resistance of one conductor of No 0 wire as per Table I Appendix B would be $10 \times 0.518 = 5.18$ ohms Each line wire in the three phase system carries 78.8 amp therefore the PR loss per conductor would be $78.8 \times 78.8 \times 5.18 = 32\,200$ watts 32.2 kw

The loss in the three wires would be $3 \times 32.2966 \text{ kw}$ For a year of 3000 hours the total energy loss would be $3000 \times 96.6289800 \text{ kw hr}$ At 1 cent per kw hr this would cost $289.800 \times 0.01 = 2.898$ Therefore the total yearly cost of the transmission equals $2.898 + 882.3780$ Since the cost of lost energy is greater than the fixed charges we compute the cost of larger wires in order to find the size of conductor which produces the lowest total annual cost Setting these down as in Table IV we see that the TABLE IV Relative Cost Of Three phase Three wire TransMission For Various Sizes Of Conductors most economical conductor would be No 0000 The most economical size for a two wire system under the same conditions was found to be 350 000 cir mils See Table I Three conductors of No 0000 wire at an
