Interactive Granular Computations in Networks and Systems Engineering: A Practical Perspective Andrzej

Jankowski, 2017-06-25 The book outlines selected projects conducted under the supervision of the author. Moreover, it discusses significant relations between Interactive Granular Computing (IGrC) and numerous dynamically developing scientific domains worldwide along with features characteristic of the author's approach to IGrC. The results presented are a continuation and elaboration of various aspects of Wisdom Technology initiated and developed in cooperation with Professor Andrzej Skowron. Based on the empirical findings from these projects, the author explores the following areas: a) understanding the causes of the theory and practice gap problem TPGP in complex systems engineering (CSE); b) generalizing computing models of complex adaptive systems (CAS) in particular natural computing models by constructing an interactive granular computing (IGrC) model of networks of interrelated interacting complex granules; c) granules belonging to a single agent and/or to a group of agents; d) developing methodologies based on the IGrC model to minimize the negative consequences of the TPGP. The book introduces approaches to the above issues using the proposed IGrC model. In particular, the IGrC model refers to the key mechanisms used to control the processes related to the implementation of CSE projects. One of the main aims was to develop a mechanism of IGrC control over computations that model a project's implementation processes to maximize the chances of its success while at the same time minimizing the emerging risks. In this regard, the IGrC control is usually performed by means of properly selected and enforced among project participants project principles. These principles constitute examples of c) granules expressed by complex vague concepts represented by c) granules too. The c) granules evolve with time in particular the meaning of the concepts is also subject of change. This methodology is illustrated using project principles applied by the author during the implementation of the POLTAX, AlgoTradix, Merix and Excavio projects outlined in the book.

The 9 research papers and 3 short papers presented together with 1 keynote and 1 challenge paper were carefully reviewed and selected from 28 submissions. SSBSE is a research area focused on the formulation of software engineering problems as search problems and the subsequent use of complex heuristic techniques to attain optimal solutions to such problems. A wealth of engineering challenges from test generation to design refactoring to process organization can be solved efficiently through the application of automated optimization techniques. SSBSE is a growing field sitting at the crossroads between AI, machine learning, and software engineering, and SSBSE techniques have begun to attain human competitive results.
