Department of Bibliography,1978      *The Regulation of Environmental Factors on the Microbial Cooperation* Hao Li,Ruichang Gao,Wei Hu,Zhenlin Han,2024-12-12 Microorganisms are widely presented in various environments such as soil water air inside or on the surface of multi cellular organisms and food There are various complicated microbial interactions including symbiosis mutualism competition antagonism and predation among the different microorganisms that coexist in the same environment forming a community These complex microbial interactions can affect various cellular behaviors such as microbial growth metabolism performance and social behavior Social behavior refers to the evolving specialization and cooperation that takes place between group members to jointly survive and understanding this cooperation evolution is still a challenge for biology and social science According to the impact experienced by the implementer and receiver social behavior can be roughly divided into four categories mutually beneficial selfish altruistic and malicious Cooperation increases the adaptability of the recipient and can be mutually beneficial or just altruistic Cooperation has been widely studied from insects to humans but its impact on microbial

populations has only been described recently Social behavior models based on dynamics and evolutionary behavior such as the snowdrift and prisoner s dilemma models have been described in microorganisms Moreover microbial cooperation is also influenced by the environmental factors in which they are located Studying the role of environmental factors on microbial cooperation from the perspective of environment microorganism interaction is of great importance for clarifying mechanisms underlying microbial cooperation and its roles

**Agriculture: Synergistic Effect on Carbon Sequestration and Crop Productivity** Jianling Fan,Yichao Shi,Yunliang Li,2025-06-26 Chemical fertilizers have been widely utilized in agriculture since the mid 20th century to enhance crop productivity However the prolonged use of chemical fertilizers has resulted in soil degradation water pollution and environmental harm Soil organic carbon is a key indicator of soil fertility which not only affected soil nutrients and fertility but also had huge potential to capture carbon dioxide CO<sub>2</sub> from the atmosphere Microorganisms play a crucial role in soil carbon and nutrient cycling and subsequently influence crop productivity carbon sequestration and soil fertility Therefore it is imperative to develop sustainable and green agricultural systems which could synergistically boost crop productivity reduce nutrient losses promote carbon sequestration improve soil health and adapt to climate change In recent years there have been many studies on sustainable agriculture However strengthening the understanding of microorganisms in promoting carbon sequestration and crop productivity is still one of the most effective means of guiding future management in sustainable and green agriculture In this research topic we aim to shed light on the mechanisms that how microorganisms in rhizosphere and or bulk soil impact nutrient uptake in plants under diverse conditions as well as their consequences for soil carbon sequestration and soil health These findings would significantly contribute to our understanding of the complex

network of genetic biochemical physical and metabolic interactions among plants microbial communities and the environment We welcome novel research articles reviews and perspectives that cover topics including molecular biology soil microbial ecology carbon sequestration and biogeochemical cycling and crop productivity promotion in agriculture Case studies and meta analyses that provide practical implications for sustainable land management practices are also welcome
