

CODOMINANCE AND INCOMPLETE DOMINANCE

CODOMINANCE – BLOOD TYPES

In humans, three different alleles can create four different phenotypes. The alleles are A, B, and O, and the phenotypes are A, B, AB, and O. The letters correspond to the carbohydrates found on the surface of a red blood cell. Since one blood type allele is inherited from each parent, there are several possible combinations that can be inherited.

Phenotype	Genotype
A	AA or AO
B	BB or BO
AB	AB
O	OO

Both A and B alleles are dominant, meaning that they determine an organism's phenotype. Because they are dominant, if one A allele and one B allele are inherited, then the blood type and genotype result is AB. This is an example of codominance, or when both alleles are expressed in the phenotype. However, the O allele is recessive, meaning that it does not affect an organism's phenotype unless there are two O alleles. If a B allele is recessed, it can still come out in the offspring but it takes a B and an O allele, or two O alleles.

INCOMPLETE DOMINANCE

In non-Mendelian genetics, some alleles are neither dominant nor recessive over the other allele. (Some alleles are actually a mix of completely dominant and recessive and are called incomplete dominance. In incomplete dominance, the heterozygous phenotype lies some where between the two homozygous phenotypes. Two alleles produce an intermediate phenotype, rather than one fully determining the phenotype.)

Snapdragons are a type of flower that exhibit incomplete dominance. The alleles for red (R) and white (W) flowers show incomplete dominance. Heterozygous (RW) plants have pink flowers – an intermediate mix of red and white coloring. Complete the following Punnett squares and write the probabilities of the phenotypes as percentages.

1. Cross a pink flower with a white flower. What is the probability the following phenotypes?

	R	W

CODOMINANCE – NON-MENDELIAN GENETICS

In complete dominance, if the genotype is heterozygous, a dominant allele takes complete control of a recessive allele. In codominance, both traits in heterozygotes are expressed. Both alleles are expressed equally in codominance, and heterozygous individuals will express both traits at the same time.

In some varieties of chickens, the allele for black feathers (B) is codominant with the allele for white feathers (W). Heterozygous chickens will have an erminette phenotype that appears as speckled with black and white feathers (BW). Answer the questions and Punnett squares. Express probabilities as percentages.

1. A black hen and a white rooster are crossed. What is the probability the following?

	B	W

2. Two black chickens are crossed. What is the probability the following?
