

**CAUTION**

If DTC B1B1B is set in the SRS-ECU, always diagnose the CAN main bus line.

**CIRCUIT OPERATION**

- The SRS-ECU judges how severe a collision is by detecting signals from the side impact sensors installed on the lower side of the center pillar. If the impact is over a predetermined level, the SRS-ECU sends an ignition signal. At this time, if the side collision safing G-sensor is on, the SRS air bag will inflate.
- The ignition signal is input to the curtain air bag module (LH) to inflate the curtain air bag.

**DTC SET CONDITIONS**

This DTC is set if there is abnormal resistance between the input terminals of the curtain air bag module (LH) (squib).

**TROUBLESHOOTING HITS**

- Improper engaged connector or defective short spring\*
- Short circuit between the curtain air bag module (LH) (squib) circuit terminals
- Damaged connector(s)
- Malfunction of the SRS-ECU

*NOTE: \*: The squib circuit connectors integrate a "short" spring (which prevents the air bag from deploying unintentionally due to static electricity by shorting the positive wire to the ground wire in the squib circuit when the connectors are disconnected) (Refer to P.52B-3). Therefore, if connector C-36, D-15 or F-28 is damaged or improperly engaged, the short spring may not be released when the connector is connected.*
