

## Functions of Special Senses

The functions of the five special senses include:

1. **Vision.** Sight or vision is the capability of the eye(s) to focus and detect images of visible light on photoreceptors in the retina of each eye that generates electrical nerve impulses for varying colors, hues, and brightness.
2. **Hearing.** Hearing or audition is the sense of sound perception.
3. **Taste.** Taste refers to the capability to detect the taste of substances such as food, certain minerals, and poisons, etc.
4. **Smell.** Smell or olfaction is the other “chemical” sense; odor molecules possess a variety of features and, thus, excite specific receptors more or less strongly; this combination of excitatory signals from different receptors makes up what we perceive as the molecule’s smell.
5. **Touch.** Touch or somatosensory, also called tactition or mechanoreception, is a perception resulting from activation of neural receptors, generally in the skin including [hair](#) follicles, but also in the tongue, throat, and mucosa.

## The Eye and Vision

Vision is the sense that has been studied most; of all the sensory receptors in the body 70% are in the eyes.

### *Anatomy of the Eye*

Vision is the sense that requires the most “[learning](#)”, and the eye appears to delight in being fooled; the old expression “You see what you expect to see” is often very true.
