

### Evaporator coils:-

The [A/C evaporator](#), or evaporator core, works as a heat exchange within a vehicle's engine. Evaporators are usually made of aluminum. They look like, and in fact are, similar to radiators, only thicker and smaller in overall size. Like radiators, evaporators consist of a series of internal tubes or "flow paths" with fins attached to them. Air can pass freely through the fins, just like a radiator. But unlike a radiator, where the internal tubes carry moving engine coolant, the passages in the evaporator carry moving refrigerant.

### Heater core:-

A heater core is a [radiator](#)-like device used in heating the cabin of a [vehicle](#). Hot [coolant](#) from the vehicle's [engine](#) is passed through a winding tube of the core, a heat exchanger between coolant and cabin air. Fins attached to the core tubes serve to increase surface for heat transfer to air that is forced past them, by a fan, thereby heating the passenger compartment.
