that solar outputs including solar irradiance and energy particles belong to the fundamental natural forces of the climate system It is consistent that the variation of solar irradiance on the orbital time scale controls glacial interglacial cycle However the contribution of solar output fluctuation due to solar activity to decadal to centennial climate change is still contradictory The common driving force mechanism is then the key role of solar climate linking research and the mechanism of solar forcing and the pathway of amplification could be two key scientific problems in climate research In recent years a lot of studies have been done on the effects of solar activity on the climate based on data analysis by observation reanalysis or mechanism tracking by modeling The interannual and decadal solar signals in the regional climate were found and the hypothesis of driving mechanisms was proposed Meanwhile the potential contribution of solar variability to the current climate prediction has attracted more and more attention The purpose of this topic is to collect and reveal new results and new understandings about the impact of solar variability on climate      *Geographical Abstracts* ,1987      **PAGES** ,1998-08
