Johnson,BATTELLE MEMORIAL INST COLUMBUS OHIO COLUMBUS LABS.,U.S. Army Air Mobility Research and Development Laboratory. Eustis Directorate,1971 The purpose of this program was to develop both the technology and the experimental hardware to experimentally demonstrate that a main engine fuel pump could be operated at turbine engine shaft speeds A single lobe vane pump has been designed and successfully operated at speeds up to 49 500 rpm and outlet pressures up to 900 psig while pumping JP 4 turbine fuel The promising capabilities demonstrated by this pump were the result of the successful application of hydrodynamic lubrication techniques to the vane design The pivoting vane tip concept incorporated permits tip surface speeds up to 180 fps to be achieved without producing high mechanical

power losses or sacrificing the pump endurance capabilities The present experimental fuel pump represents a significant step toward the development of flight hardware capable of operating at engine shaft speed It meets the basic performance requirements of a main engine fuel pump typically required on small highspeed gas turbine engines In addition it appears that a variable displacement capability could be developed directly from the present hardware without altering the established high speed capabilities Author How to Install and Use the Kennor Fuel Pump Control System: How to install the Kennor fuel pump control system ,1984

Development of an Ejector Pump Engine Fuel Feed System H. F.

Winchester,R. H. Van Dyke,C. J. Moinat,DOUGLAS AIRCRAFT CO LONG BEACH CA AIRCRAFT DIV.,1967 An ejector pump engine fuel feed system was designed and developed The system consists of an ejector fuel pump and a fuel tank sump with a swirl jet and a flexible fuel pickup tube Several types of ejector pumps were tested which included the simple ejector a dual series induced flow ejector a parallel induced flow ejector and a dual operation ejector with two concentric nozzles An annular ring type nozzle was tested in addition to the normal central nozzle The system as developed will pump JP 4 or JP 5 fuel at temperatures up to 200 F to an engine at a flow rate of 70 000 pounds per hour with a pump discharge pressure of 34 psia The swirl jet in the sump tank provides fluid rotation and a resulting radial force to position the fuel at the wall of the sump tank at all times This insures that fuel will be at a known location during periods of zero gravity The fuel is then delivered to the ejector pump through a flexible hose type fuel pickup tube The end of the pickup is normally on the bottom at the tank wall During periods of negative gravity the pickup will bend upward to draw fuel from the top of the sump area Flight tests were conducted on a scale model of the sump swirl system to demonstrate the zero gravity provisions Author
