Chest Pain of Recent Onset, 2010 Chest pain or discomfort caused by acute coronary syndromes ACS or angina has a potentially poor prognosis emphasising the importance of prompt and accurate diagnosis Treatments are available to improve symptoms and prolong life hence the need for this guideline This guideline covers the assessment and diagnosis of people with recent onset chest pain or discomfort of suspected cardiac origin In deciding whether chest pain may be cardiac and therefore whether this guideline is relevant a number of factors should be taken into account These include the person's history of chest pain their cardiovascular risk factors history of ischaemic heart disease and any previous treatment and previous investigations for chest pain For pain that is suspected to be cardiac there are two separate diagnostic pathways presented in the guideline The first is for people with acute chest pain in whom ACS is suspected and the second is for people with intermittent stable

chest pain in whom stable angina is suspected The guideline includes how to determine whether myocardial ischaemia is the cause of the chest pain and how to manage the chest pain while people are being assessed and investigated The diagnosis and management of chest pain that is clearly unrelated to the heart e g traumatic chest wall injury herpes zoster infection is not considered once myocardial ischaemia has been excluded The guideline makes no assumptions about who the patient consults where that consultation takes place primary care secondary care emergency department or what diagnostic facilities might be available It recognizes that while atherosclerotic CAD is the usual cause of angina and ACS it is not a necessary requirement for either diagnosis Similarly it recognises that in patients with a prior diagnosis of CAD chest pain or discomfort is not necessarily cardiac in origin
