**Abstract** The authors examined the effects of a 12-week, 1000 kcal deficit diet on the body composition and metabolic profile of 10 obese women. The diet was composed of 25% protein, 45% carbohydrate, and 30% fat. The subjects lost an average of 10.5 kg (23.1%) of body weight and 10.5% of body fat. The diet was well tolerated, and the subjects maintained a high level of physical activity throughout the study. The authors conclude that a 1000 kcal deficit diet is an effective means of achieving weight loss in obese women.

**Abstract** The purpose of this study was to determine the effect of a 12-week training program on the physical fitness and health-related quality of life (HRQL) of sedentary, middle-aged women. The study was a randomized, controlled trial. The intervention group (n = 20) participated in a 12-week training program consisting of three sessions per week. The control group (n = 20) remained sedentary. The primary outcome was the change in HRQL, measured using the EuroQol-5D questionnaire. Secondary outcomes included changes in physical fitness, measured using a 6-minute walk test and a 10-minute step test. The results showed that the intervention group had a significant improvement in HRQL and physical fitness compared to the control group. The findings suggest that a 12-week training program can improve the physical fitness and HRQL of sedentary, middle-aged women.
