Iterative Learning Control Convergence Robustness And Applications:

Iterative Learning Control Yangquan Chen, Changyun Wen, 2014-03-12 This book provides readers with a comprehensive coverage of iterative learning control. The book can be used as a text or reference for a course at graduate level and is also suitable for self study and for industry oriented courses of continuing education. Ranging from aerodynamic curve identification robotics to functional neuromuscular stimulation. Iterative Learning Control (ILC) started in the early 80s is found to have wide applications in practice. Generally a system under control may have uncertainties in its dynamic model and its environment. One attractive point in ILC lies in the utilisation of the system repetitiveness to reduce such uncertainties and in turn to improve the control performance by operating the system repeatedly. This monograph emphasises both theoretical and practical aspects of ILC. It provides some recent developments in ILC convergence and robustness analysis. The book also considers issues in ILC design. Several practical applications are presented to illustrate the effectiveness of ILC. The applied examples provided in this monograph are particularly beneficial to readers who wish to capitalise the system repetitiveness to improve system control performance.

Iterative Learning Control Hyo-Sung Ahn, Kevin L. Moore, Yangquan Chen, 2007-06-28 This monograph studies the design of robust monotonically convergent iterative learning controllers for discrete time systems. Iterative learning control (ILC) is well recognized as an efficient method that offers significant performance improvement for systems that operate in an iterative or repetitive fashion e.g. robot arms in manufacturing or batch processes in an industrial setting. Though the fundamentals of ILC design have been well addressed in the literature two key problems have been the subject of continuing search activity. First many ILC design strategies assume nominal knowledge of the system to be controlled. Only recently has a comprehensive approach to robust ILC analysis and design been established to handle the situation where the plant model is uncertain. Second it is well known that many ILC algorithms do not produce monotonic convergence though in applications

monotonic convergence can be essential. This monograph addresses these two key problems by providing a unified analysis and design framework for robust monotonically convergent ILC. The particular approach used throughout is to consider ILC design in the iteration domain rather than in the time domain. Using a lifting technique the two dimensional ILC system which has dynamics in both the time and iteration domains is transformed into a one dimensional system with dynamics only in the iteration domain. The so called super vector framework resulting from this transformation is used to analyze both robustness and monotonic convergence for typical uncertainty models including parametric interval uncertainties, frequency like uncertainty in the iteration domain and iteration domain stochastic uncertainty.

Iterative Learning Control Zeungnam Bien, Jian-Xin Xu, 2012-12-06

Iterative Learning Control (ILC) differs from most existing control methods in the sense that it exploits every possibility to incorporate past control information such as tracking errors and control input signals into the construction of the present control action. There are two phases in Iterative Learning Control: first the long term memory components are used to store past control information; then the stored control information is fused in a certain manner so as to ensure that the system meets control specifications such as convergence, robustness, etc. It is worth pointing out that those control specifications may not be easily satisfied by other control methods as they require more prior knowledge of the process in the stage of the controller design. ILC requires much less information of the system variations to yield the desired dynamic behaviors. Due to its simplicity and effectiveness, ILC has received considerable attention and applications in many areas for the past one and half decades. Most contributions have been focused on developing new ILC algorithms with property analysis. Since 1992 the research in ILC has progressed by leaps and bounds. On one hand, substantial work has been conducted and reported in the core area of developing and analyzing new ILC algorithms. On the other hand, researchers have realized that integration of ILC with other control techniques may give rise to better controllers that exhibit desired performance which is impossible by any individual approach.

Iterative Learning Control David H. Owens, 2015-10-31

This book develops a coherent and quite general theoretical approach to algorithm design for iterative learning control based on the use of operator representations and quadratic optimization concepts including the related ideas of inverse model control and gradient based design. Using detailed examples taken from linear discrete and continuous time systems, the author gives the reader access to theories based on either signal or parameter optimization. Although the two approaches are shown to be related in a formal mathematical sense, the text presents them separately as their relevant algorithm design issues are distinct and give rise to different performance capabilities. Together with algorithm design, the text demonstrates the underlying robustness of the paradigm and also includes new control laws that are capable of incorporating input and output constraints, enable the algorithm to reconfigure systematically in order to meet the requirements of different reference and auxiliary signals, and also to support new properties such as spectral annihilation. Iterative Learning Control will interest academics and graduate

students working in control who will find it a useful reference to the current status of a powerful and increasingly popular method of control. The depth of background theory and links to practical systems will be of use to engineers responsible for precision repetitive processes.

Iterative Learning Control with Passive Incomplete Information Dong Shen, 2018-04-16. This book presents an in depth discussion of iterative learning control (ILC) with passive incomplete information, highlighting the incomplete input and output data resulting from practical factors such as data dropout, transmission disorder, communication delay etc. a cutting edge topic in connection with the practical applications of ILC. It describes in detail three data dropout models: the random sequence model, Bernoulli variable model and Markov chain model for both linear and nonlinear stochastic systems. Further, it proposes and analyzes two major compensation algorithms for the incomplete data: namely the intermittent update algorithm and successive update algorithm. Incomplete information environments include random data dropout, random communication delay, random iteration varying lengths and other communication constraints. With numerous intuitive figures to make the content more accessible, the book explores several potential solutions to this topic, ensuring that readers are not only introduced to the latest advances in ILC for systems with random factors but also gain an in depth understanding of the intrinsic relationship between incomplete information environments and essential tracking performance. It is a valuable resource for academics and engineers as well as graduate students who are interested in learning about control, data driven control, networked control systems and related fields.

Key issues in ILC design and implementation in linear and nonlinear plants pervading mechatronics and batch processes are addressed in particular. ILC design in the continuous and discrete time domains, design in the frequency and time domains, design with problem specific performance objectives including robustness and optimality, design in a modular approach by integration with other control techniques and design by means of classical tools based on Bode plots and state space.
