Application Forms For Uj:

Normal Forms and Unfoldings for Local Dynamical Systems James Murdock, 2006-04-10 The subject of local dynamical systems is concerned with the following two questions 1 Given an $n \times n$ matrix A describe the behavior in a neighborhood of the origin of the solutions of all systems of differential equations having a rest point at the origin with linear part Ax that is all systems of the form $\dot{x} = Ax + \dots$ where $x \in \mathbb{R}^n$ and the dots denote terms of quadratic and higher order 2 Describe the behavior near the origin of all systems close to a system of the type just described To answer these questions the following steps are employed 1 A normal form is obtained for the general system with linear part Ax The normal form is intended to be the simplest form into which any system of the intended type can be transformed by changing the coordinates in a prescribed manner 2 An unfolding of the normal form is obtained This is intended to be the simplest form into which all systems close to the original system can be transformed It will contain parameters called unfolding parameters that are not present in the normal form found in step 1 vi Preface 3 The normal form or its unfolding is truncated at some degree k and the behavior of the truncated system is studied

Lectures on Kähler Geometry Andrei Moroianu, 2007-03-29 Kähler geometry is a beautiful and intriguing area of mathematics of substantial research interest to both mathematicians and physicists This self contained graduate text provides a concise and accessible introduction to the topic The book begins with a review of basic differential geometry before moving on to a description of complex manifolds and holomorphic vector bundles Kähler manifolds are discussed from the point of view of Riemannian geometry and Hodge and Dolbeault theories are outlined together with a simple proof of the famous Kähler identities The final part of the text studies several aspects of compact Kähler manifolds the Calabi conjecture Weitzenböck techniques Calabi-Yau manifolds and divisors All sections of the book end with a series of exercises and students and researchers working in the fields of algebraic and differential geometry and theoretical physics will find that the book provides them with a sound understanding of this theory

Classical Mechanics With Applications Porter W Johnson, 2010-01-29 This textbook appropriate for a one semester course in classical mechanics at the late undergraduate or early graduate level presents a fresh modern approach to mechanics About 150 exercises covering a wide variety of topics and applications have solutions roughly outlined for enhanced understanding Unique to this text is the versatile application of programming language Mathematica throughout to analyze systems and generate results Coverage is also devoted to the topic on one dimensional continuum systems The extensive discussions on inverse problems of mechanical systems and the detailed analysis of stability of classical systems certainly make this an outstanding textbook

Estimation of Nonlinear Greybox Models for Marine Applications Fredrik Ljungberg, 2020-05-27 As marine vessels are becoming increasingly autonomous having accurate simulation models available is turning into an absolute necessity This holds both for facilitation of development and for achieving satisfactory model based control When accurate ship models are sought it is necessary to account for nonlinear hydrodynamic effects and to deal with environmental disturbances in a correct

way In this thesis parameter estimators for nonlinear regression models where the regressors are second order modulus functions are analyzed This model class is referred to as second order modulus models and is often used for greybox identification of marine vessels The primary focus in the thesis is to find consistent estimators and for this an instrumental variable IV method is used First it is demonstrated that the accuracy of an IV estimator can be improved by conducting experiments where the input signal has a static offset of sufficient amplitude and the instruments are forced to have zero mean This two step procedure is shown to give consistent estimators for second order modulus models in cases where an off the shelf applied IV method does not in particular when measurement uncertainty is taken into account Moreover it is shown that the possibility of obtaining consistent parameter estimators for models of this type depends on how process disturbances enter the system and on the amount of prior knowledge about the disturbances probability distributions that is available In cases where the first order moments are known the aforementioned approach gives consistent estimators even when disturbances enter the system before the nonlinearity In order to obtain consistent estimators in cases where the first order moments are unknown a framework for estimating the first and second order moments alongside the model parameters is suggested The idea is to describe the environmental disturbances as stationary stochastic processes in an inertial frame and to utilize the fact that their effect on a vessel depends on the vessel s attitude It is consequently possible to infer information about the environmental disturbances by over time measuring the orientation of a vessel they are affecting Furthermore in cases where the process disturbances are of more general character it is shown that supplementary disturbance measurements can be used for achieving consistency Different scenarios where consistency can be achieved for instrumental variable estimators of second order modulus models are demonstrated both in theory and by simulation examples Finally estimation results obtained using data from a full scale marine vessel are presented I takt med att marina farkoster blir mer autonoma krävs behovet av noggranna matematiska farkostmodeller Modellerna behövs för att förklara utvecklingen av nya farkoster och för att kunna styra farkosterna autonomt med önskad precision För att erhålla alla nödvändiga modeller behöver olinjära hydrodynamiska effekter samt systemstörningar förstås orsakade av vind och vattenströmmar tas i beaktning I detta arbete undersöks metoder för att skatta önska storheter i modeller för marina farkoster givet observerad data Undersökningen gäller en speciell typ av olinjära modeller som ofta används för att beskriva marina farkoster Huvudfokus i arbetet är att erhålla konsistens vilket betyder att de skattade storheterna ska antas tillräckligt nära de observerade data för att användas som redan etablerad statistisk metod som baseras på instrumentvariabler Det visas först att noggrannheten i modellskattningsmetoden kan förbättras om datainsamlingsexperimenten utförs på ett sätt så att farkosten har signifikant nollskild hastighet och instrumentvariablernas medelvärde dras bort Den här tvärgående analysen visar varför delaktigt vid skattning av parametrar i den ovan nämnda modelltypen framför allt dämpningskoefficient tas i beaktning Vidare ses det att möjligheten att erhålla konsistenta skattningsmetoder beror på hur mycket kunskap om systemstörningarna som finns tillgänglig
