Radiometric Dating

Radioactive Speed Dating

Purpose: To correctly estimate the age of the various virtual objects (skulls, rocks, etc.) using the principles of radiometric dating

PhET simulation: "Radioactive Dating Game" (available at <http://phet.colorado.edu/en/simulation/radioactive-dating-game>)

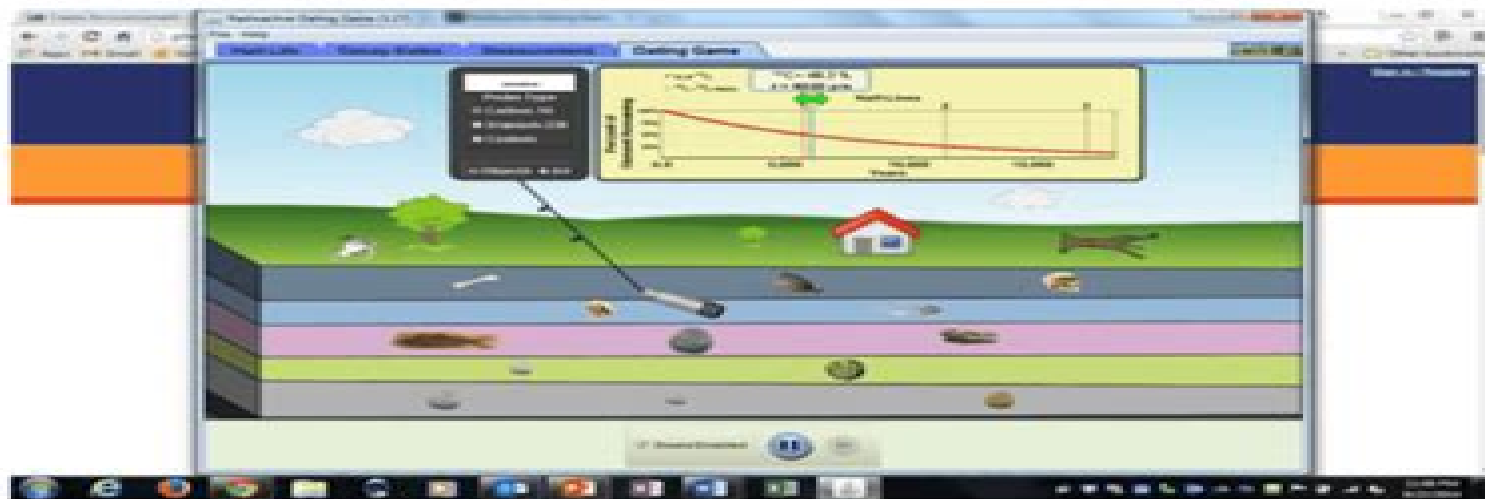

Discussion:

Radiometric dating is a nuclear decay-based method for determining the age of very old things. Here's how it works: Radioactive nuclei transform from one nuclear structure to another at a mathematically reliable rate. In a given amount of time, half the original nuclei have decayed to the new nuclear structure. That given amount of time is called the "half-life." After one half-life, half of the original nucleus remains. After two half-lives, a quarter remains, and so on. By measuring the percent of the original nuclei that remain, the age of the decaying sample can be determined. For example, carbon-14 has a half-life of 5700 years. If an object were found in which 25.0% of the original carbon-14 remained, the age of the object would be taken as approximately 11,400 years (see chart we have completed in class). Other percentages can be translated to ages using an exponential function.
