Rivaes,2025-08-08 Aquatic plant communities are crucial components of freshwater ecosystems often governing the ecological equilibrium and functionality of rivers streams and wetlands They encompass a diverse range of submerged emergent and floating plants supporting the overall balance and resilience of aquatic ecosystems They play a key role in various ecological and environmental contexts including ecosystem stability and the global carbon cycle as well as providing vital habitats for a diverse range of organisms Several factors shape the aquatic ecosystems ranging from light depth temperature of the water water flow and biotic factors to other external stressors that have over time modified the tolerance and presence of these communities Further research is required to shed light on the impact of increasing environmental changes and the need for a thorough understanding of how aquatic plant communities respond to such alterations The main goal of this Research Topic is to examine the complexities of aquatic plant communities and their dynamic interactions with different environmental factors We aim to explore aquatic plant functional diversity and compare its potential to reveal these interactions We also hope to investigate interactions between plants and other biological elements as well as how they cope with biological invasions Another goal is to examine the diverse responses of wetland vegetation to expected changes in the environmental factors driven by climate change We encourage scientists to submit their insights into the adaptive strategies of these communities Ultimately we hope to enhance our understanding of the ecological roles played by aquatic plants and to encourage effective conservation and management strategies for these vital ecosystems
