Module B

Assessment Anchors 2 Answer these questions in AT LEAST 2 Complete Sentences

MS-B.2.2.1 Describe and/or predict observed patterns of inheritance (i.e., dominant, recessive, codominance, incomplete dominance, sex-linked, polygenic, and multiple alleles).

Dominant- The trait that will show. **Recessive**- Must be copied for trait to be frequent. **Codominance** both show (like A/B blood type).

Incomplete dominance- when both alleles make part. New trait is related to genes. **Polygenic**- many genes. **Multiple alleles**- more than two alleles pair alleles up the trait.

MS-B.2.2.2 Describe processes that can alter chromosome or number of chromosomes (i.e., crossing over, nondisjunction, duplication, translocation, deletion, insertion, and inversion).

Crossing over Where the ends of the chromosomes switch.
Nondisjunction Chromosomes don't separate.

Duplication makes an extra chromosome/segment.
Deletion loses a chromosome/segment.

Inversion adds a section.
Translocation flip a section (ABC → CAB).

MS-B.2.2.3 Describe how genetic mutations alter the DNA sequence and how or they may affect phenotype (e.g., silent, nonsense, frameshift).

Silent mutation do not change phenotype.

Nonsense changes sequence that doesn't make sense.

Frameshift moves what is read to code.

MS-B.2.2.4 Explain how genetic engineering has impacted the fields of medicine, forensics, and agriculture (e.g., selective breeding, gene editing, cloning, genetically modified organisms, gene therapy).

Transcriptional and Epigenetic Landscapes of Abiotic Stress Response in Plants Aamir W. Khan,Yezhang Ding ,Mehanathan Muthamilarasan,2025-01-31 The scientific community is currently focusing on climate resilience to ensure food and nutritional security Understanding the molecular mechanisms underlying stress response is the key to tweaking the key regulators for enhancing this trait Climate resilience is a dynamic process controlled by transcriptional and epigenetic regulators Therefore it is imperative to study transcriptional changes and epigenetic modifications regulating stress responses and manipulate candidate genes alleles QTLs mQTLs to achieve biotic and abiotic stress resilience To recognize the full landscape of variations driving these phenotypic changes multi omics approaches must be used to understand these factors along with genetic variations To feed the ever growing population and tackle the uncertainties in environmental changes deploying genomics and sequencing is a viable solution Plant cells must modify their chromatin states and adjust their transcriptional profile to respond better to environmental stimuli These chromatin modifications include DNA methylation histone variants post transcriptional histone modifications and variations in non coding RNA activities Exploring transcriptional dynamics and epigenetic changes simultaneously with the natural variations present in the population sub population is necessary This will provide us with a full picture of different mechanisms driving the phenotypic changes and will help in developing better resilient varieties by utilizing this multi omics driven knowledge

Marker-Assisted Selection (MAS) in Crop Plants, volume II Ting Peng,Baohua Wang,Muhammad Kashif Riaz Khan

,Peng Chee,2024-06-13 Global climate change reductions in arable land and food security demands that plant breeding will continue to play an imperative role in feeding 9 billion people sustainably by 2050 In order to face this challenge modern plant breeding will necessitate the adoption of new technologies and practices to boost production of cultivated plants by

capturing or generating more favorable genetic diversity In crop plants the majority of agronomically important traits are quantitatively inherited controlled by multiple genes each with a small effect quantitative trait loci QTLs The most common approach to pre breeding is to use genetic mapping to identify QTLs for key phenotypic variation followed by introgressing those QTLs into the elite gene pool with marker assisted selection MAS which can enhance the selection criteria of phenotypes comparing to conventional breeding with the selection of genes As the cost of genotyping continues to decline the use of genotyping by sequencing GBS technologies or whole genome re sequencing coupled with the release of the genome sequences of plant species have permitted the development of dense arrays of single nucleotide polymorphisms SNPs covering the entire genome which have in turn paved the way to genome wide association studies GWAS Meanwhile fine mapping guided by genome sequences of many plant species have facilitated the exploration of functional genes in addition pan genomes constructed from various available resources such as the reference sequence and its variants raw reads and haplotype reference panels provide a new perspective on QTL locations and potential molecular targets for plant breeding Similarly new approaches to marker trait association analyses such as quantitative trait locus sequencing QTL seq and quantitative trait gene sequencing QTG seq that are based on bulked segregant analysis BSA and whole genome resequencing will help accelerate QTL fine mapping and identification of the causal genes In conclusion the tools and strategies for MAS in modern plant breeding have been expanding in recent years By embracing a broad array of conventional and new molecular techniques modern plant breeding has a bright future in delivering new crop cultivars to keep our food fiber and biobased economy diverse and safe
