## **AP Biology LAB 2**

### **ENZYME CATALYSIS**

#### **OVERVIEW**

In this lab you will:

1. observe the conversion of hydrogen peroxide ( $H_2O_2$ ) to water and oxygen gas by the enzyme catalase, and
2. calculate the rate of the enzyme-catalyzed reaction.

#### **OBJECTIVES**

**Before doing this lab you should understand:**

- the general functions and activities of enzymes;
- the relationship between the structure and function of enzymes;
- the concept of initial reaction rates of enzymes;
- how the concept of free energy relates to enzyme activity;
- that changes in temperature, pH, enzyme concentration, and substrate concentration can affect the initial reaction rates of enzyme-catalyzed reactions; and
- catalyst, catalysis, and catalase

**After doing this lab you should be able to:**

- measure the effects of changes in temperature, pH, enzyme concentration, and substrate concentration on reaction rates of an enzyme-catalyzed reaction in a controlled experiment, and
- explain how environmental factors affect the rate of enzyme-catalyzed reactions.

#### **INTRODUCTION**

In general, **enzymes** are important proteins produced by living cells; they act as catalysts in biochemical reactions. A catalyst affects the rate of a chemical reaction. In some cases, enzymes increase the speed of reactions that would otherwise occur slowly, and carry out complex chemical activities at relatively low temperatures.

Enzymes are involved in nearly all metabolic processes. In an enzyme-catalyzed reaction, the substance to be acted upon, the **substrate (S)**, binds reversibly to the active site of the **enzyme (E)**. One result of this temporary union is a reduction in the energy required to activate the reaction of the substrate molecule so that the **products (P)** of the reaction are formed. In summary:
