Overarching Question: How and why do organisms interact with the living and nonliving environments to obtain matter and energy?

Big Ideas:

- Ecosystems are typically in a state of stability.
- The relationships between biotic and abiotic factors in an ecosystem help maintain stability.
- Symbiotic relationships create an interdependence in ecosystems.
- Energy for ecosystems comes from the sun and is transferred between organisms through the food chain.
- Invasive species outcompete native species in an ecosystem and threaten stability.
- Ecosystems undergo change due to environmental factors: human impact, natural disasters, invasive species, and climate changes.
- Organisms rely on visual and auditory methods of communication within ecosystems.

Need To Know:

- Ecosystems can sustain only a set number of organisms. Limiting factors determine how many organisms can survive in an ecosystem.
- Symbiotic relationships are classified as mutualism, commensalism, parasitism, and predation.
- Producers, Consumers, and Decomposers all play a role in food chains.
- The energy pyramid demonstrates that organisms use 90% of the energy obtained from food and pass on only 10%.
- Biomes are areas of the world with specific climates, abiotic and biotic factors. (Tundra, Taiga, Deciduous Forest, Desert, Grasslands, RainForest, Marine and Freshwater)
