

DNA REPLICATION STUDY-GUIDE

DNA REPLICATION

01 ENZYMES

Replication involves an assembly of enzymes, among which DNA polymerase is the most important. It is a polymerase, which means it can build a polymer out of monomers.

- DNA polymerase** (DNA pol) is the enzyme that builds the double helix by transferring nucleotides to the growing strand.
- DNA helicase** (DNA helicase) is the enzyme that unwinds the double helix by breaking hydrogen bonds between the base pairs.
- DNA primase** (DNA primase) is the enzyme that synthesizes a short RNA primer to which DNA pol can add nucleotides.
- DNA ligase** (DNA ligase) is the enzyme that joins the Okazaki fragments on the lagging strand.

4) DNA Pol III adds nucleotides to the 3' end of the growing strand.

5) DNA Pol III adds nucleotides to the 3' end of the growing strand.

6) DNA Pol III adds nucleotides to the 3' end of the growing strand.

7) DNA Pol III adds nucleotides to the 3' end of the growing strand.

8) DNA Pol III adds nucleotides to the 3' end of the growing strand.

9) DNA Pol III adds nucleotides to the 3' end of the growing strand.

10) DNA Pol III adds nucleotides to the 3' end of the growing strand.

11) DNA Pol III adds nucleotides to the 3' end of the growing strand.

12) DNA Pol III adds nucleotides to the 3' end of the growing strand.

13) DNA Pol III adds nucleotides to the 3' end of the growing strand.

14) DNA Pol III adds nucleotides to the 3' end of the growing strand.

15) DNA Pol III adds nucleotides to the 3' end of the growing strand.

16) DNA Pol III adds nucleotides to the 3' end of the growing strand.

17) DNA Pol III adds nucleotides to the 3' end of the growing strand.

18) DNA Pol III adds nucleotides to the 3' end of the growing strand.

19) DNA Pol III adds nucleotides to the 3' end of the growing strand.

20) DNA Pol III adds nucleotides to the 3' end of the growing strand.

02 DIRECTIONALITY

Because DNA polymerase III can only add nucleotides to the 3' end of a growing strand, synthesis is directional. It is called the 5' to 3' direction.

The leading strand is synthesized continuously towards the replication fork. The lagging strand is synthesized discontinuously away from the fork as Okazaki fragments.

03 PROOFREADING

DNA polymerase III has a proofreading function. It can remove a nucleotide that has been added incorrectly and replace it with the correct one. This is called the 3' to 5' exonuclease activity.

After replication, the DNA double helix is still not perfect. There are still some errors. These are called mutations.

DNA REPLICATION

02 DNA BASE SEQUENCE

The order of bases in a DNA molecule is its base sequence. This sequence determines the structure and function of proteins.

Each triplet of bases (codon) corresponds to a specific amino acid sequence, determining the structure and function of proteins.

Nucleotides contain a phosphate group, a sugar, and a nitrogenous base. The phosphate group is attached to the sugar, which is attached to the nitrogenous base.

01 DNA STRUCTURE

DNA is a double-stranded molecule composed of nucleotides, each containing a phosphate group, a deoxyribose sugar, and a nitrogenous base.

The two strands run antiparallel (5' to 3' and 3' to 5') and are held together by hydrogen bonds between the nitrogenous bases. The bases are complementary: Adenine (A) pairs with Thymine (T), Guanine (G) pairs with Cytosine (C).

The sugar-phosphate backbone provides structural stability and protects the genetic code stored in the base sequence.

03 SEMI-CONSERVATIVE

When a cell divides, DNA replication occurs. Each new DNA molecule consists of one original (parental) strand and one newly synthesized (daughter) strand.

Replication is **semi-conservative** because the two strands that form the new DNA molecule are one original strand and one newly synthesized strand.

The double helix unwinds, and complementary nucleotides pair with each existing nucleotide, according to the base pairing rules (A-T, C-G).

04 ENZYMES

Specialized enzymes help coordinate replication.

- Helicase** breaks the double helix, creating the replication fork.
- DNA polymerase** adds nucleotides to the growing strand, checking for errors as it goes.
- DNA ligase** joins the Okazaki fragments on the lagging strand.

Other enzymes support strand separation and reconnection of fragments. These proteins ensure that DNA replication is accurate and that the genetic code is preserved.

05 KEY TERMS

Nucleotide
Basic unit of DNA, composed of a phosphate, deoxyribose sugar, and nitrogenous base.

Semi-conservative replication
Each new DNA molecule contains one original strand.

Template strand
The original DNA strand used to synthesize a complementary copy.

Antiparallel
Strands run in opposite directions (5' to 3' and 3' to 5').

Helicase
Enzyme that breaks the double helix.

DNA Polymerase
Enzyme that synthesizes the new DNA strand by adding nucleotides.
