[2] Function and Structure

[A] Function

The pilot valve is the valve that controls the direction and volume of the stroke of the control valve, and lowers the primary pressure from the control valve to a secondary pressure only as much as is necessary to move the control valve spool.

KOBELCO 900R 900R 900R

[B] Operation

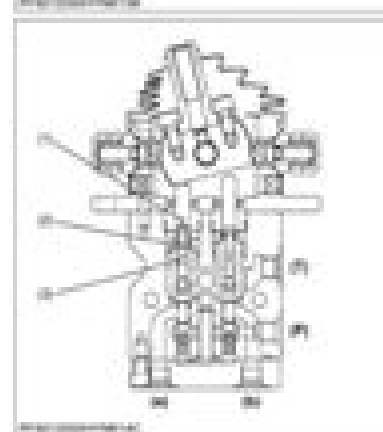

1. When the control lever is in neutral

The force of the secondary pressure spring (1) does not press on the spool (2). Consequently, spool (2) is pushed up by the return spring (3), and port 1 (1) and port 2 (2) are connected.

2. When the control lever has been actuated

When the control lever is lifted and pushed (1) goes through its stroke, spool (2) moves downwards, port 1 (1) and port 2 (2) are connected, and oil from the pilot pump flows via port 1 to the control valve.

The pressure at the port rises until it is equivalent to the force of the secondary pressure spring (1), thus balancing the hydraulic pressure on the spool with the force of the secondary pressure spring and maintaining a fixed port pressure.
