This book synthesizes research findings on patterns in the last twenty years or so in order to argue for a theory of graded
representations in pattern generalization While research results drawn from investigations conducted with different age level
groups have sufficiently demonstrated varying shifts in structural awareness and competence which influence the eventual
shape of an intended generalization such shifts however are not necessarily permanent due to other pertinent factors such as
the complexity of patterning tasks The book proposes an alternative view of pattern generalization that is one that is not
about shifts or transition phases but graded depending on individual experiences with target patterns The theory of graded
representations involving pattern generalization offers a much more robust understanding of differences in patterning
competence since it is sensitive to varying levels of entry into generalization Empirical evidence will be provided to
demonstrate this alternative view which is drawn from the author s longitudinal work with elementary and middle school
children including several investigations conducted with preservice elementary majors Two chapters of the book will be
devoted to extending pattern generalization activity to arithmetic and algebraic learning of concepts and processes The
concluding chapter addresses the pedagogical significance of pattern learning in the school mathematics curriculum **The**
