*Adult and Pluripotent Stem Cells* Jürgen Hescheler, Erhard Hofer, 2014-04-21 There is hardly an area of research developing so quickly and raising so many promises as stem cell research Adult embryonic and recently available induced pluripotent stem cells not only foster our understanding of differentiation of endo ecto and mesodermal lineages to all organs of the body but foremost nourish the hope that cells grown in culture can be used for regeneration of diseased organs such as the heart damaged by myocardial infarction This book focuses on perspectives of stem cells for regenerative therapy of cardiovascular diseases Based on the EC consortium INELPY it reviews the field and disseminates major outcomes of this project Thus it introduces the reader to this fascinating area of research and incorporates very recent findings interesting to the expert spanning the field from bench to bedside The compilation of contributions is unique as there is yet no similar comprehensive overview combining stem cell research with preclinical and clinical evaluation as well as engineering of tissue patches for transplantation As such it will be an invaluable source of information for all researchers in the stem cell and tissue regeneration field including bioengineers as well as for all clinicians interested in regenerative therapies especially for ischemic cardiomyopathies **Stem Cells in Clinic and Research** Ali Gholamrezanezhad, 2011-08-23 Based on our current understanding of cell biology and strong supporting evidence from previous experiences different types of human stem cell

populations are capable of undergoing differentiation or trans differentiation into functionally and biologically active cells for use in therapeutic purposes So far progress regarding the use of both in vitro and in vivo regenerative medicine models already offers hope for the application of different types of stem cells as a powerful new therapeutic option to treat different diseases that were previously considered to be untreatable Remarkable achievements in cell biology resulting in the isolation and characterization of various stem cells and progenitor cells has increased the expectation for the development of a new approach to the treatment of genetic and developmental human diseases Due to the fact that currently stem cells and umbilical cord banks are so strictly defined and available it seems that this mission is investigationally more practical than in the past On the other hand studies performed on stem cells targeting their conversion into functionally mature tissue are not necessarily seeking to result in the clinical application of the differentiated cells In fact still one of the important goals of these studies is to get acquainted with the natural process of development of mature cells from their immature progenitors during the embryonic period onwards which can produce valuable results as knowledge of the developmental processes during embryogenesis For example the cellular and molecular mechanisms leading to mature and adult cells developmental abnormalities are relatively unknown This lack of understanding stems from the lack of a good model system to study cell development and differentiation Hence the knowledge reached through these studies can prove to be a breakthrough in preventing developmental disorders Meanwhile many researchers conduct these studies to understand the molecular and cellular basis of cancer development The fact that cancer is one of the leading causes of death throughout the world highlights the importance of these researches in the fields of biology and medicine
