Evaluation , 2006 **Introduction to Piping Quality Control** Ram Babu Sao, 2025-03-23 The terms Quality Control and

Quality Assurance are often used interchangeably but they are not synonymous Quality Assurance is a program executed by

company management Quality Control is a task that takes place on the production floor Two aspects are quality control QC

and quality assurance QA Understanding these programs and their roles is critical in making sure the respective engineer to

carry out their duties effectively There are three most important criteria for evaluating the Quality Control of work such as

Cost Time of delivery and Quality Quality is most important factor out of the three Quality isn't simply a cost It is a powerful

tool that contributes to the economic success of the work Therefore there is need to control all three but quality is the most

significant Many manufacturers recognize that quality leads to a higher customer retention rate and helps to build

competitive boundaries However the term quality by itself isn't sufficient ISO 9000 definitions the QC is the operational

techniques and activities that are utilized to fulfil requirements for quality and QA is all those planned and systematic

activities implemented to provide adequate confidence that the entity will fulfil requirements for quality QC is a production

line function The aim of QC is to offer the highest reasonable quality of product or service to the client thereby meeting or

even exceeding the client's requirements The QA manager is interested in investigating technologies and processes that

prevent defects QA is a staff function The aim of QA is to apply a planned and systematic production process establishing

confidence that the process generates suitable products QC method is intended to provide regular product inspection

thereby guaranteeing the output's correctness completeness and integrity It finds and addresses mistakes They file and

record all the QC procedures The product or service needs to be suitable and fit for the intended purpose The methods and

processes should decrease errors and shortcomings the first time through the manufacturing process QC is product oriented

it focuses on tests and inspections carried out at various production line checkpoints QA is process oriented its concerns are

process definitions proper selection of tools proper use of testing methods and operator training QC works at locating defects QA works at preventing them QC emphasizes testing of products to discover defects and reporting the results to management QA attempts to improve and stabilize production to minimize or prevent the conditions that trigger defects Typically quality control involves problem identification problem analysis problem correction and feedback Quality assurance involves data collection problem trend analysis process identification process analysis and process improvement
