Russian Fractals in Indigenous Artifacts Abdul Karim Bangura,Leonid A. Zhigun,2025-06-22 This book is the first comprehensive work on Russian Fractals in indigenous artifacts While existing works focus on universal phenomena such as liquid crystal or finance none explore the intersection between Fractals and Russia Russian Fractals in Indigenous Artifacts therefore investigates how indigenous Russian cultures have a wonderful Fractal heritage that was originally tied to socially just and ecologically sustainable social practices including those of indigenous northern groups such as the Yakut Fractal designs originally allowed unalienated value both human and nonhuman to be visible thereby enabling just and sustainable living This book also examines how the tsarist elite encouraged the creation of unique creative masterpieces developing and strengthening traditional crafts and art of indigenous people hence Faberg or imperial architecture Today the challenge for contemporary Russia is to reestablish the relationship between the social and ecological sustainability of indigenous cultures and practices for which we can now provide modeling and analysis Lay attempts at this have only limited success as they

have based the attempts on a purely religious basis which recognizes the ecological aspects but often succumbs to authoritarian nationalism. However, the freely accession of indigenous peoples to Russia for the sake of national liberation has had a positive effect on enriching them with spirituality and creativity by Fractal artifacts through friendly exchanges with one another. In Russian Fractals in Indigenous Artifacts, Bangura and Zhigun express why there is a need for a forward thinking Fractal renaissance in Russia bringing together contemporary computational and scientific analyses with these ecologically and socially sustainable traditions.

Should we aim for genetic improvement in host resistance or tolerance to infectious disease? Andrea B. Doeschl-Wilson, Ilias Kyriazakis, Recent advances in quantitative genetic and genomic studies have shed light on the important role of genetic control strategies for reducing disease risk and severity in livestock populations. There are two alternative host defence strategies to infectious pathogens that could be enhanced by genetic selection: improvement of host resistance versus improvement of host tolerance to infectious pathogens. Resistance refers to mechanisms that restrict the reproduction rate of a pathogen within a host whilst tolerance mechanisms focus on minimising the damage that a pathogen inflicts on the host. Both strategies may have a similar impact on individual host fitness and performance but can have contrasting effects on population performance and disease risk and severity. For

example improving host resistance may result in successful eradication of a disease from a livestock population whereas disease eradication may be difficult if hosts are tolerant as these can harbour the pathogen without showing obvious or severe symptoms On the other hand it has been argued that increasing host resistance would fuel the arms race between host and pathogen and stimulate pathogen evolution towards higher virulence Increasing tolerance in contrast imposes no or little selection pressure on the pathogen Further whereas disease resistance mechanisms may be specific to a particular pathogen e g development of specific antibodies tolerance mechanisms that repair damaged tissues are associated with the host rather than the pathogen and are thus more likely to be generic to a range of pathogens Hence improving tolerance may be beneficial if individuals are exposed to a variety of pathogens or pathogen strains and disease eradication has proven difficult In contrast to evolutionary biology and plant breeding animal breeding has only recently started to seriously consider a distinction between disease resistance and tolerance and their consequences However a deeper understanding of the underlying mechanisms and implications of improving either or both of the host defence mechanisms on future disease risk and severity is urgently needed by animal scientists veterinarians and breeders to make informed decisions that help to maintain healthy livestock populations and guarantee food security The topic genetic improvement of disease resistance v tolerance would lend itself to research papers covering a variety of aspects that need to be considered such as how to obtain genetic parameter estimates and genomic breeding values related to disease resistance tolerance evidence for host genetic influence of resistance or tolerance genetic genomic and immunological understanding of resistance tolerance mechanisms epidemiological consequences of improving disease resistance tolerance I believe that this research topic is both timely and relevant and that sufficient knowledge is available across disciplines for composing valuable research review articles that stimulate interest to a wide range of readers of Frontiers and thus promote the growth of this journal
