Directions: Solve each of the following problems, using the available space for scratch work. Decide which is the best of the choices given and fill in the corresponding oval on the answer sheet. No credit will be given for anything written in the test book. Do not spend too much time on any one problem.

1. The statistics below provide a summary of the distribution of heights, in inches, for a simple random sample of 200 young children.

Mean: 46 inches
Median: 45 inches
Standard Deviation: 3 inches
First Quartile: 43 inches
Third Quartile: 48 inches

About 100 children in the sample have heights that are

- (A) less than 43 inches
- (B) less than 48 inches
- (C) between 43 and 48 inches
- (D) between 40 and 52 inches
- (E) more than 46 inches

2. In which of the following situations would it be most difficult to use a census?

New Directions in Assessing Historical Thinking Kadriye Ercikan, Peter Seixas, 2015-02-20 New technologies have radically transformed our relationship to information in general and to little bits of information in particular The assessment of history learning which for a century has valued those little bits as the centerpiece of its practice now faces not only an unprecedented glut but a disconnect with what is valued in history education More complex processes historical thinking historical consciousness or historical sense making demand more complex assessments At the same time advances in scholarship on assessment open up new possibilities For this volume Kadriye Ercikan and Peter Seixas have assembled an international array of experts who have collectively moved the fields of history education and assessment forward Their various approaches negotiate the sometimes conflicting demands of theoretical sophistication empirically demonstrated validity and practical efficiency Key issues include articulating the cognitive goals of history education the relationship between content and procedural knowledge the impact of students language literacy on history assessments and methods of validation in both large scale and classroom assessments New Directions in Assessing Historical Thinking is a critical research oriented resource that will advance the conceptualization design and validation of the next generation of history assessments

Protein Solubility and Aggregation in Bacteria Salvador Ventura, 2016-09-26 Proteins suffer many conformational changes and interactions through their life from their synthesis at ribosomes to their controlled degradation Only folded and soluble proteins are functional Thus protein folding and solubility are controlled genetically transcriptionally and at the protein sequence level In addition a well conserved cellular machinery assists the folding of polypeptides to avoid misfolding

and ensure the attainment of soluble and functional structures When these redundant protective strategies are overcome misfolded proteins are recruited into aggregates Recombinant protein production is an essential tool for the biotechnology industry and also supports expanding areas of basic and biomedical research including structural genomics and proteomics Although bacteria still represent a convenient production system many recombinant polypeptides produced in prokaryotic hosts undergo irregular or incomplete folding processes that usually result in their accumulation as insoluble aggregates narrowing thus the spectrum of protein based drugs that are available in the biotechnology market In fact the solubility of bacterially produced proteins is of major concern in production processes and many orthogonal strategies have been exploited to try to increase soluble protein yields Importantly contrary to the usual assumption that the bacterial aggregates formed during protein production are totally inactive the presence of a fraction of molecules in a native like structure in these assemblies endorse them with a certain degree of biological activity a property that is allowing the use of bacteria as factories to produce new functional materials and catalysts The protein embedded in intracellular bacterial deposits might display different conformations but they are usually enriched in beta sheet rich assemblies resembling the amyloid fibrils characteristic of several human neurodegenerative diseases This makes bacterial cells simple but biologically relevant model systems to address the mechanisms behind amyloid formation and the cellular impact of protein aggregates Interestingly bacteria also exploit the structural principles behind amyloid formation for functional purposes such as adhesion or cytotoxicity In the present research topic we collect papers addressing all the issues mentioned above from both the experimental and computational point of view
