VEGIUM LAB

Average Atomic Mass

Objectives

- Determine the weight of each isotope of the fictitious element VEGIUM.
- Determine the relative abundances of the isotopes of vegium.
- Calculate from experimental data the atomic mass of vegium.

Introduction

Isotopes are atoms of the same atomic number having different masses due to different numbers of neutrons. The atomic mass of an element is a weighted average, taking into account both the mass and relative abundance of each isotope of that element as it occurs in nature. The relative abundances and masses of small atomic particles are measured in the laboratory by an instrument called a mass spectrometer. The mass spectrometer separates particles by mass and measures the mass and relative abundance of each type of particle it studies. From these data a weighted average is calculated to determine the atomic mass of the element.

Purpose

In this lab you will carry out experiments and perform the necessary calculations to determine the atomic mass of vegium. Three isotopes of vegium have been observed in nature: beans, peas, and black-eyed peas. These isotopes are different varieties of vegium having different masses. Unlike real isotopes, the individual isotopic particles (beans, peas, and blackeyed peas) differ slightly in mass, so you will determine the average mass of each type of isotopic particle. Then you will determine the relative abundance of each isotope, and use this data along with the isotopic masses to calculate the weighted average mass, or atomic mass, of vegium.

Materials & Equipment

a sample of vegium
electronic balance
weighing boat (to act as a weighing dish)

Experimental Procedure

Carry out the following steps and record your results in your data table. Show all calculations neatly on a separate sheet of paper. Report all numbers to four significant figures.

1. Weigh all the beans, then all the peas, then all the blackeye peas. Record your data.
2. Count all the beans, then all the peas, then all the black-eye peas. Record your data.
