

# Fossil Patterns Show the Order of Flood Deposits

Because there is a clear order in the rock layers, we can look closely at the fossils contained in each of these layers to get clues about why the creatures were deposited in this particular sequence. We find a definite sequence of fossils (Figure 4) that show evidence of waters rising and progressively burying different ecological zones. We also see patterns of fossilized tracks in rock layers lower than we find the actual fossilized creature (Figures 5-6).

## VERTEBRATE TRACKWAYS BELOW VERTEBRATE FOSSILS (FIGURE 6)

Reptile footprints (right) are found much lower than the fossilized bodies of reptiles in the Grand Canyon. This strange pattern is easy to explain if the reptiles were scrambling to safety with each incoming deposit, until they died in exhaustion.

## TRILOBITE TRACKS ABOVE TRILOBITE FOSSILS (FIGURE 5)

Trilobite footprints (bottom right) are consistently found lower than the fossilized bodies of trilobites (upper right). This pattern makes sense if these shallow marine invertebrates were scrambling to safety with each incoming deposit of mud, until they died in exhaustion.

## ORDER OF CREATURES BURIED IN THE GRAND STAIRCASE (FIGURE 4)

This table identifies the types of fossils found in each rock layer.

The fossils in bold text represent the first appearance of that type of fossil.
