important role in guiding plant growth and development Plants adapted to extreme conditions such as those in desert or saline environments harbor microbes in their rhizosphere or endosphere that help to provide the required physiological resistance necessary to survive in those environments Microorganisms like bacteria fungi and viruses associated with plant roots increase plants resistance to various abiotic and biotic stresses Microorganisms also moderate stress for crop plants paving the way for sustainable agriculture

Genomic Evaluation of Haddock (Melanogrammus Aeglefinus L.) Broodstock D. J. Martin-Robichaud,2006 To preserve all previous efforts made in the development of haddock aquaculture in the Canadian Maritime provinces it was essential to support the continued maintenance and improvement of the existing haddock broodstock as a foundation for future aquaculture diversification Industry and government representatives joined resources to secure the existence and genetic improvement of haddock broodstock for future commercial marine finfish culture Various year classes of F1 and F2 cultured haddock were selected based on their growth performance anJ maintained at two research facilities Genotyping was done using five DNA microsatellite markers and the genomic data was consolidated into a common database Genotype data from both groups of fish were compared and showed a high level of relatedness within sites In Shippagan 156 of 218 fish were related to at least one other at the sibling level and all but one was related to at least one other at the half sibling level In comparison 165 of 248 fish from the St Andrews Biological Station SABS were related to at least one other at the sibling level while 220 or 248 were related to at least one other at the half sibling level Results indicate that although some fish at both sites originate fi om the same parental stock the two populations are now genetically quite distinct Even with high relatedness among fish it is possible to improve the genetic heterozygosity of both stocks through planned breeding To maximize the effective breeding stock fish should be shared between the two sites since fish at each site contain unique alleles and additional wild stock should be incorporated into further breeding endeavors

Consumers regulators and the food industry increasingly require that foods comply not only with label descriptions of food content but also with information regarding the food's origin. For example, the wine industry has a long history of labeling wines based on varietal, regional, or age/vintage related properties. However, regulatory agencies are now beginning to require methods to confirm this label information. Food retailers are also facing voluntary or mandatory labeling requirements that will indicate regional or country of origin, species, and/or varietal information. As a result, development of reliable analytical methods to confirm the authenticity of the label information is needed. This book presents the latest research on food and wine authentication. The chapters are authored by leading international scientists whose research focuses on the development and application of analytical methodologies used for the authentication of food and beverages.
