CELL REPRODUCTION**Section 10-3: Cell Division**

Read the passage below, which covers topics from your textbook. Answer the questions that follow.

Interphase is a nonreproductive phase that is divided into four phases: prophase, metaphase, anaphase, and telophase. Prophase is the first phase of mitosis. Prophase begins with the dissolving and breaking up of DNA into small, compact chromosomes that can be seen as thin, thread-like structures. During the 4 phases, each chromosome is copied. The two copies of each chromosome, called **sister chromatids**, are connected to each another by two structures. At the same time, centrioles and the new form microtubules move and disappear. Prophase actually goes through another stage called telophase and cytokinesis. The chromosomes move toward opposite poles of the cell and spindle fibers pull them from chromosomes to poles of the cell.

Metaphase is the second phase of mitosis. During metaphase, chromosomes move toward the chromosomes to the center of the dividing cell.

Anaphase is the third phase of mitosis. During anaphase, sister chromatids separate and move toward opposite poles of the cell. After the chromosomes separate, they are connected to be individual chromosomes.

Telophase is the fourth phase of mitosis. During telophase, sister chromatids separate and move toward opposite poles of the cell. Spindle fibers break down and disappear. A new cell membrane forms around each set of chromosomes, and a new cell forms for each of the two new daughter cells.

Cells are constantly dividing and growing in tissues. While the cells are nonreproductive, they are still present in the reproductive cells.

10-3-1: Reproductive Cell Division

Reproductive division, the process of dividing cells, is the process of dividing cells into two daughter cells.

1. prophase

2. metaphase

3. anaphase

4. telophase

5. _____ The chromosomes of each chromosome separate at the poles.
