Adaptable Embedded Systems Antonio Carlos Schneider Beck,Carlos Arthur Lang Lisbôa,Luigi Carro,2012-11-27 As embedded systems become more complex designers face a number of challenges at different levels they need to boost performance while keeping energy consumption as low as possible they need to reuse existent software code and at the same time they need to take advantage of the extra logic available in the chip represented by multiple processors working together This book describes several strategies to achieve such different and interrelated goals by the use of adaptability Coverage includes reconfigurable systems dynamic optimization techniques such as binary translation and trace reuse new memory architectures including homogeneous and heterogeneous multiprocessor systems communication issues and NOCs fault tolerance against fabrication defects and soft errors and finally how one can combine several of these techniques together to achieve higher levels of performance and adaptability The discussion also includes how to employ specialized software to improve this new adaptive system and how this new kind of software must be designed and programmed **Model-Based Design of Adaptive Embedded Systems** Twan Basten,Roelof Hamberg,Frans Reckers,Jacques Verriet,2013-03-15 This book describes model based development of adaptive embedded systems which enable improved functionality using the same resources The techniques presented facilitate design from a higher level of abstraction focusing on the problem domain rather than on the solution domain thereby increasing development efficiency Models are used to capture system specifications and to implement manually or automatically system functionality The authors demonstrate the real impact of adaptivity on engineering of embedded systems by providing several industrial examples of the models used in the development of adaptive embedded systems **Special Issue on Dynamically Adaptable Embedded Systems** John Lach,Kia Bazargan,2004 **Special Issue on Dynamically Adaptable Embedded Systems** ,2004 **Software Engineering and Algorithms in Intelligent Systems** Radek Silhavy,2018-05-16 This book presents new software engineering approaches and methods discussing real world problems and exploratory research that describes novel approaches modern design techniques hybrid algorithms and empirical methods This book constitutes part of the refereed proceedings of the Software Engineering and Algorithms in Intelligent Systems Section of the 7th Computer Science On line Conference 2018 CSOC 2018 held in April 2018 Modeling the Adaptation Behavior of Adaptive Embedded Systems Mario Trapp,2005 **Intelligent Information and Database Systems** Ngoc Thanh Nguyen,Chong-Gun Kim,Adam Janiak,2011-04-15 The two volume set LNAI 6591 and LNCS 6592 constitutes the refereed proceedings of the Third International Conference on Intelligent Information and Database Systems ACIIDS 2011 held in Daegu Korea in April 2011 The 110 revised papers presented together with 2 keynote speeches were carefully reviewed and selected from 310 submissions The papers are thematically divided into two volumes they cover the following topics intelligent database systems data warehouses and data mining natural language processing and computational linguistics semantic Web social

controllers and a context task based coordinator The cognitive plane is responsible for dynamic adaptable logic reconfiguration inspired by fuzzy cognitive maps Proof of concept firmware was developed for a wireless physiological sensor showing context collector implementation An ATE automatic test equipment test architecture was also developed for the sensor highlighting architecture development and providing the groundwork for the context controller development The lead up to the cognitive engine is explored in an introduction to fuzzy cognitive maps its implementations and applications to current research An industrial application Novax s Accessible Pedestrian System APS and simulations using the Rapita suite of tools are presented   *Interactive Systems* ,2002   Adaptability and Reconfiguration of Automotive Embedded Systems Amel Belaggoun,2017 Modern vehicles have become increasingly computerized to satisfy the more strict safety requirements and to provide better driving experiences Therefore the number of electronic control units ECUs in modern vehicles has continuously increased in the last few decades In addition advanced applications put higher computational demand on ECUs and have both hard and soft timing constraints hence a unified approach handling both constraints is required Moreover economic pressures and multi core architectures are driving the integration of several levels of safety criticality onto the same platform Such applications have been traditionally designed using static approaches however static approaches are no longer feasible in highly dynamic environments due to increasing complexity and tight cost constraints and more flexible solutions are required This means that to cope with dynamic environments an automotive system must be adaptive that is it must be able to adapt its structure and or behaviour at runtime in response to frequent changes in its environment These new requirements cannot be faced by the current state of the art approaches of automotive software systems Instead a new design of the overall Electric Electronic E E architecture of a vehicle needs to be developed Recently the automotive industry agreed upon changing the current AUTOSAR platform to the AUTOSAR Adaptive Platform This platform is being developed by the AUTOSAR consortium as an additional product to the current AUTOSAR classic platform This is an ongoing feasibility study based on the POSIX operating system and uses service oriented communication to integrate applications into the system at any desired time The main idea of this thesis is to develop novel architecture concepts based on adaptation to address the needs of a new E E architecture for Fully Electric Vehicles FEVs regarding safety reliability and cost efficiency and integrate these in AUTOSAR We define the ASLA Adaptive System Level in AUTOSAR architecture which is a framework that provides an adaptive solution for AUTOSAR ASLA incorporates tasks level reconfiguration features such as addition deletion and migration of tasks in AUTOSAR The main difference between ASLA and the Adaptive AUTOSAR platform is that ASLA enables the allocation of mixed critical functions on the same ECU as well as time bound adaptations while adaptive AUTOSAR separates critical hard real time functions running on the classic platform from non critical soft real time functions running on the adaptive platform To assess the validity of our proposed architecture we provide an early prototype implementation of ASLA and evaluate its performance through experiments   **Neural and Adaptive Systems** José C.
