The Engineers' Digest, 1953 **Novel Bioderived Composites from Wastes** Andrea Petrella, Marco Race, Danilo Spasiano, 2020-11-20 The recovery of solid wastes for the preparation of innovative composite materials not only represents an economic advantage but also offers an ecological opportunity for the utilization of by-products which would otherwise be landfilled. Specifically, the reuse and recycling of waste lead to important savings of raw materials and energy since these by-products generally derive from agricultural or industrial activities that are abundant in nature. Moreover, a reduction of the environmental and related sanitary impacts can be also achieved. For this reason, a recycling operation is fundamental for the improvement of the environmental sustainability because these secondary raw materials become a resource that can be easily reused without the modification of the peculiar characteristics in order to obtain new and performing composites with a low specific weight, high durability, and long life cycle.
