bioinformatics analysis of omics data for biomarker identification in clinical research The advances and the decreasing cost of omics data enable profiling of disease molecular features at different levels including bulk tissues animal models and single cells Large volumes of omics data enhance the ability to search for information for preclinical study and provide the opportunity to leverage them to understand disease mechanisms identify molecular targets for therapy and detect biomarkers of treatment response Identification of stable predictive and interpretable biomarkers is a significant step towards personalized medicine and therapy Omics data from genomics transcriptomics proteomics epigenomics metagenomics and metabolomics help to determine biomarkers for prognostic and diagnostic applications Preprocessing of omics data is of vital importance as it aims to eliminate systematic experimental bias and technical variation while preserving biological variation Dozens of normalization methods for correcting experimental variation and bias in omics data have been developed during the last two decades while only a few consider the skewness between different sample states such as the extensive over repression of genes in cancers The choice of normalization methods determines the fate of identified biomarkers or molecular signatures From these considerations the development of appropriate normalization methods or preprocessing strategies may promote biomarker identification and facilitate clinical decision making

*Exotic Bromegrasses in Arid and Semiarid Ecosystems of the Western US* Matthew J. Germino, Jeanne C. Chambers, Cynthia S. Brown, 2016-01-22 Invasions by exotic grasses particularly annuals rank among the most extensive and intensive ways that humans are contributing to the transformation of the earth's surface The problem is particularly notable with a suite of exotic grasses in the *Bromus* genus in the arid and semiarid regions that dominate the western United States which extend from the dry basins near the Sierra and Cascade Ranges across the Intermountain Region and Rockies to about 105° longitude This genus includes approximately 150 species that have a wide range of invasive and non-invasive tendencies in their home ranges and in North America *Bromus* species that became invasive upon introduction to North America in the late 1800s such as *Bromus tectorum* and *B. rubens* have since become the dominant cover on millions of hectares Here millenia of ecosystem development led to landscapes that would otherwise be dominated by perennial shrubs herbs and biotic soil crusts that were able to persist in spite of variable and scarce precipitation This native ecosystem resilience is increasingly coveted by land owners and managers as more hectares lose their resistance to *Bromus* grasses and similar exotics and as climate land use and disturbance regime changes are also superimposed Managers are increasingly challenged to glean basic services from these ecosystems as they become invaded Exotic annual grasses reduce wildlife and livestock carrying capacity
