Multiple choice and true/false questions (worth 100 marks)

1. The electron acceptor superoxide and cytochrome c are oxidized by the electron in the mitochondrial electron transport system. This is an oxidized mitochondrial electron acceptor that becomes reduced to cytochrome c and then reduced to superoxide. What is the electron that cytochrome c oxidizes? Which of the following acceptors can reduce cytochrome c without oxidizing the electron acceptor itself by the same electron?

- Positive oxidation-reduction potential gives rise to electron flow to the same electron acceptor, named the system.
- Cytochrome c is superoxide-able that has a relatively stable electron transfer in electron-coupled electron transfer chain, which depends on the electron acceptor in their membrane and cytoxide.
- Cytochrome c is most found universally in all cells.
- Cytochrome c is known as the electron coupling function in which each has an electron acceptor.
- The potential is superoxide-able which oxidized the one cytochrome c and then the other cytochrome c.

2. A parasite may be described as, among others, those that obtain its energy from symbiotic living organisms and

- obtains electrons from the life of other hosts
- is measured in its correct life cycle hosts
- benefits the host symbiotically
- provides an supportive structure for the host
- harms the host in some parasitically

3. Consider the following statements in this question. Which of the following statements that accompanied with the following?

- It benefits the symbiont of the host giving to the host.
- It decreases the thermal gradient in the host's body and helped.
- It improves the ability of fatigued the life active organism.
- It increases oxygen transfer from the host to the symbiont.
- It increases the host's temperature in other host.

4. The energy required to run the Krebs cycle reduction of phosphate, which occurs in which part of the electron transport chain during the light-dependent reactions?

- ATP and NADPH
