

Longitudinal Motion (Stick Fixed)

"The equilibrium and stability of a fixed-wing aircraft, in its various modes of flying, occupies one of the principal parts of the subject of aerobalistic specifications, and the adequate explanation of the principles involved has hitherto been given."

Frederick W. Lanchester, *Aerobalistics* [4.1], published in 1909, in which he develops an elementary theory of longitudinal dynamic stability.

4.1

HEURISTICAL PERSPECTIVE

The theoretical basis for the analysis of fixed-wing motion developed almost concurrently with the successful demonstration of a powered flight, of a human-carrying airplane. As early as 1897, Frederick Lanchester was studying the motion of gliders. He conducted experiments with hand-launched gliders and found that the gliders would fly along a straight path if they were launched at what he called the glider's natural speed. Launching the glider at a higher or lower speed would lead to an oscillatory motion. He also noticed that, if launched at its "natural speed" and then disturbed from its flight path, the glider would return unstably along its flight trajectory. What Lanchester had discovered was that all flight vehicles possess certain natural frequencies or motions when disturbed from their equilibrium flight.

Lanchester called the oscillatory motion the glugged motion. He wanted to use the Greek word meaning "to fly" to describe his newly discovered motion. Initially, glugged meant "to flap." Today, we still use the term glugged to describe the long period slowly damped oscillation associated with the longitudinal motion of an airplane.

The mathematical treatment of fixed-wing motions was first developed by G. H. Bryan. He was aware of Lanchester's experimental observations and set to develop the mathematical equations for dynamic stability analysis. His stability work was published in 1911. Bryan made significant contributions to the analysis of vehicle flight motions. He laid the mathematical foundation for airplane dynamic stability analysis, developed the concept of the aerodynamic stability derivatives, and recognized that the equations of motion could be rearranged into a symmetric longitudinal motion and an asymmetric lateral motion. Although the mathematical treatment of airplane dynamic stability was developed, then by 1911 the first
