Introductory College Physics, Solutions Manual Atam Parkash Arya, 1979 General Organic and Biological Chemistry John R. Amend, 1993-08 *Sm Fundamentals Chemistry* T/I Burns, 1999-03 QCD Radiation in Top-Antitop and Z+Jets Final States Kiran Joshi, 2015-06-12 This thesis contains new research in both experimental and theoretical particle physics making important contributions in each Two analyses of collision data from the ATLAS experiment at the LHC are presented as well as two phenomenological studies of heavy coloured resonances that could be produced at the LHC The first data analysis was the measurement of top quark antiquark production with a veto on additional jet activity As the first detector corrected measurement of jet activity in top antitop events it played an important role in constraining the theoretical modelling and ultimately reduced these uncertainties for ATLAS's other top quark measurements by a factor of two The second data analysis was the measurement of Z 2jet production and the observation of

the electroweak vector boson fusion VBF component As the first observation of VBF at a hadron collider this measurement demonstrated new techniques to reliably extract VBF processes and paved the way for future VBF Higgs measurements The first phenomenological study developed a new technique for identifying the colour of heavy resonances produced in proton proton collisions As a by product of this study an unexpected and previously unnoticed correlation was discovered between the probability of correctly identifying a high energy top and the colour structure of the event it was produced in The second phenomenological study explored this relationship in more detail and could have important consequences for the identification of new particles that decay to top quarks
