1.	What are the objectives for this experiment? (you can summarize)			
2.	Make a hypothesis about how you think the two species of Paramecium will grow alone and how they will grow when they are grown together. I think they both will grow more rapidly than together. Together they will overload the carrying capacity.			
3.	Explain how you tested your hypothesis. I ran three samples, each separate and then together, and test the growth rate every two days.			
4.	On what day did the <i>Paramecium caudatum</i> population reach the carrying capacity of the environment when it was grown alone? How do you know?
