

Procedure with pictures:

1. In translation, the ribosome attaches to the mRNA. To model this, lay the mRNA strip in the ribosome piece so that the codon show through the top window.

2. Next, the tRNA with the complementary anticodon is matched to the codon in the mRNA. Find the tRNA with the anticodon at the top that compliments the first mRNA codon. Slide it into the ribosome so that the anticodon is just under the codon in the top window, and the amino acid shows in the bottom window. Secure the anticodon to the codon with a small piece of tape to hold it in place.

3. Slide the ribosome to the next codon. In translation, the ribosome bonds the amino acids from the tRNA to form a chain as it moves down the mRNA. Model this by inserting the next tRNA with an anticodon that corresponds to the mRNA codon. Tape the anticodon to the codon to hold it in place and use another small piece of tape to attach the amino acids together.
4. Continue down the mRNA strip until tRNA has been matched to all the codons. Remove the assembled strip from the ribosome. Use this strip to fill in your data table.

5. Have your teacher check your amino acid sequence. If it is correct, you may cut the amino acid sequence away from the tRNAs. Make sure the amino acids stay taped together. Write your completed amino acid sequence into the data table. Glue your amino acid sequence into to box. Dispose of any trash.
