Scleroderma is a chronic disease that can cause thickening, hardening or tightening of the skin, blood vessels and internal organs. There are 2 types: localized scleroderma, which mainly affects the skin, and systemic scleroderma which may affect many internal organs. The symptoms include skin changes, Raynaud's disease, arthritis, muscle weakness, and dry mucous membranes. With scleroderma, the body produces and deposits too much collagen, causing thickening and hardening. In addition to the client's skin and subcutaneous tissues becoming increasing hard and rigid, the extremities stiffen and lose mobility. Contractures develop with advanced systemic scleroderma unless clients follow a regimen of range of motion and muscle strengthening exercises.
