Land Use Nature Conservation And The Stability Of Rainforest Margins In Southeast Asia:

Land Use, Nature Conservation and the Stability of Rainforest Margins in Southeast Asia Gerhard Gerold, Michael Fremerey, Edi Guhardja, 2013-06-29 Southeast Asia constitutes one of the world's most extended rainforest regions. It is characterized by a high degree of biodiversity and contains a large variety of endemic species. Moreover, these forests provide a number of important and singular ecosystem services like erosion protection and provision of high quality water which cannot be replaced by alternative ecosystems. However, various forms of encroachment, mostly those made by human interventions, seriously threaten the continuance of rainforests in this area. There is ample evidence that the rainforest resources apart from large scale commercial logging are exposed to danger, particularly from its margin areas. These areas, which are characterized by intensive man-nature interaction, have been identified as extremely fragile systems. The dynamic equilibrium that balances human needs and interventions on the one hand and natural regeneration capacity on the other is at stake. The decrease of rainforest resources is to a substantial degree connected with the destabilization of these systems. Accordingly, the search for measures and processes which prevent destabilization and promote stability is regarded as imperative. This refers to both the human and the natural part of the forest margin ecosystem.

Tropical Rainforests and Agroforests under Global Change Teja Tscharntke, Christoph Leuschner, Edzo Veldkamp, Heiko Faust, Edi Guhardja, Arifuddin Bidin, 2010-02-04 not only for land use systems that depend on the regular supply of rain or irrigation water but also for the future development of natural rainforests as drought stress has been shown to affect tree growth and species composition in old growth forests. Wright 1991, Walsh and Newbery 1999, Engelbrecht et al 2007. A drought experiment conducted in a cacao agroforestry plantation showed that this plantation was surprisingly resilient to an induced drought of more than a year. Schwendenmann et al 2009. However, droughts can have a strong impact on household incomes from agriculture; they strongly affect the vulnerability to poverty and thus have to be analyzed as important exogenous shocks to households forcing them to adjust their behaviour and develop strategies to cope with these problems. The stability of rainforest margins is a critical factor in the protection of tropical rainforests. Tscharntke et al 2007. At present, however, rainforest margins in many parts of the tropics are far from stable both in socio-economic and in ecological terms. For example, protected areas may attract rather than repel human settlement, which may be due to international donor investment in national conservation programs. Wittemeyer et al 2008. An alternative hypothesis is that protected areas might be compromised if leakage takes place, that is, if impacts that would take place inside the restricted area are displaced to a nearby undisturbed area. Ewers and Rodrigues 2008.

Shifting Cultivation Policies Malcolm Cairns, 2017-11-13. Shifting cultivation supports around 200 million people in the Asia Pacific region alone. It is often regarded as a primitive and inefficient form of agriculture that destroys forests, causes soil erosion and robs lowland areas of water.

These misconceptions and their policy implications need to be challenged Swidden farming could support carbon sequestration and conservation of land biodiversity and cultural heritage This comprehensive analysis of past and present policy highlights successes and failures and emphasizes the importance of getting it right for the future This book is enhanced with supplementary resources The addendum chapters can be found at www.cabi.org/openresources/91797

Routledge Handbook of Forest Ecology Kelvin S.-H. Peh, Richard T. Corlett, Yves Bergeron, 2015-10-16 This comprehensive handbook provides a unique resource covering all aspects of forest ecology from a global perspective It covers both natural and managed forests from boreal temperate sub tropical and tropical regions of the world The book is divided into seven parts addressing the following themes forest types forest dynamics forest flora and fauna energy and nutrients forest conservation and management forests and climate change human impacts on forest ecology While each chapter can stand alone as a suitable resource for a lecture or seminar the complete book provides an essential reference text for a wide range of students of ecology environmental science forestry geography and natural resource management Contributors include leading authorities from all parts of the world

Proceedings Daniel Stietenroth, 2005 This international symposium featured three interconnected thematic foci of interdisciplinary research They focussed on the changes in the extent and intensity of agricultural and forest land use in tropical forest margins and their implications for rural development and for conservation of natural resources such as biodiversity soils and water The symposium took place in Goettingen Almost 130 international authors have contributed a short abstract and their address

Economic Modeling of Agricultural Land Use Patterns in Forest Frontier Areas Miet Maertens, 2003 The Social

Ecology of Tropical Forests Wil de Jong,Tuck-Po Lye,Ken-ichi Abe,2006 The Social Ecology of Tropical Forests brings together various analyses from the three major tropical regions Southeast Asia the Amazon basin and Sub Saharan Africa and by challenging simplistic correlations the authors explore the complex relationships between deforestation and migration The book provides both an historical overview of migration into these regions and presents contemporary case studies to reveal the complex interplay of factors motivating migration The scope of the discussion is extensive covering historical issues such as the impact of the slave trade on Sub Saharan African forests and communities and contemporary dilemmas like the over exploitation of natural forest products in Vietnam The authors look at the broader picture of intertwining political social geographical environmental and historical influences without seeking quick fix solutions to the social and environmental issues arising from increasing forest cover loss The analyses are spatially and temporally contextualized drawing on both qualitative and quantitative data to provide a useful resource for studying the societies of tropical regions and their social ecology
