**General Introduction** An electrophile is an electron-seeking species, reacting with a lone pair or a double bond.

### Electrophilic Substitution

Electrophilic Substitution reactions are reactions in which an electrophile reacts with a nucleophile.

- It forms an electrophilic intermediate (a carbocation) from the electrophile and the nucleophile.
- The electrophilic intermediate is then attacked by a nucleophile, which forms a new bond, resulting in the product.

Electrophilic Substitution reactions are classified into three types:  $S_N1$ ,  $S_N2$ , and  $S_Ni$ .

- The first type involves a carbocation intermediate, which is then attacked by a nucleophile.
- The second type involves a concerted mechanism, where the nucleophile attacks the electrophile and the leaving group leaves simultaneously.

When reacting a nucleophile with an electrophile, the following reactions occur:

### Electrophilic Substitution

- In the following mechanism, a nucleophile attacks the electrophile, forming a carbocation intermediate. The nucleophile then attacks the carbocation, forming the product.
