1. Plate tectonics is the generally accepted scientific theory that considers the earth's lithosphere to comprise a number of large tectonic plates which have been slowly moving since about 3.4 billion years ago. Rift valleys may be caused when heat rises and forms under all these plates causing convection currents to move together, from side to side or pull apart from each other. Rift valleys are caused by Destructive/convergent plate boundary. Its when the ocean and continental plates collide, when this happens the oceanic plate goes under the continental plate which causes subduction. A rift valley is formed as a result of sinking of a portion of the crust between cracks on the surface of the earth. Layers of rock are subjected to tension or stress. Faults or cracks develop in the layers and the central block begins to subside. After subsidence a depression with steep sides is formed. The Great Rift valley of Africa is a special physical feature of the southern plateau. It is along narrow valley formed as a result of vertical cracks that developed because of the movement within the earth. It extends for a total distance of 5000 km from the lake Malawi through the red sea and Gulf Aquaba to the Dead sea in Jordan.
