

Read the following text carefully.

The earth's total water supply is estimated to be 330 million cubic miles. The problem is that 96% of it is found in the oceans and is saline. A little over 2% is tied up in icecaps and glaciers, and nearly 1% in the earth's atmosphere. Ground water, fresh water lakes, and rivers account for just 0.6% of the fresh water. The net result is that 99.7% of all the water on earth is not available for human and animal consumption. Of the remaining 0.3%, much is inaccessible due to unreachable locations and depths, and the vast majority of water for human and animal consumption is stored in ground water.

An important feature of the earth's supply of fresh water is its non-uniform distribution around the globe. Water, for which there are no substitutes, has always been mankind's most precious resource. The struggle to control water resources has shaped human political and economic history. Due to its scarcity and vital importance for the development of a country, water has been a source of tension whenever water resources are shared by neighbouring peoples.

Water-related tensions around the world can have significant implications. In the Middle East, for example, water is a source of conflict not only between Israel and its Arab neighbours, but also between Egypt and Sudan, and Turkey, Syria, and Iraq. Many have forgotten that the progression towards the 1967 War was triggered by the water dispute between Israel and Syria over control over the Jordan River.

Population growth and economic development are driving a steadily increasing demand for new water supplies, and global demand for water has more than tripled over the past half century. Globally, the largest user of fresh water is agriculture, accounting for roughly three quarters of total use. In Africa this fraction approaches 90%. In the U.S., agriculture accounts for 39% of fresh water use, the same fraction used for cooling thermal power plants.

Future prospects are not encouraging. Global water withdrawal in 2000 was estimated to be about 30% of the world's total accessible fresh water supply. By 2025 that fraction may reach 70%.
