Biodiversity of Soil Invertebrates Stefano Bocchi, Francesca Orlando, 2021-01-06 Soil fauna plays a key role in many soil functions such as organic matter decomposition humus formation and nutrient release modifying soil structure and improving its fertility Soil invertebrates play key roles in determining soil suitability for agricultural production and realizing sustainable farming systems They include an enormous diversity of arthropods nematodes and earthworms However this fauna suffers from the impact of agricultural activities with implications for the capacity of soil to maintain its fertility and provide ecosystem services Some agricultural practices may create crucial soil habitat changes with consequences for invertebrate biodiversity In the few last decades especially under intensive and specialized farming systems a loss in soil ecosystem services has been observed as a result of the reduction in both the abundance and taxonomic diversity of soil faunal communities On the other hand agricultural practices based on sustainable soil management can promote useful soil fauna Therefore the concerns about the sensibility of soil biota to the agricultural practices make it urgent to develop sustainable management strategies able to realize favorable microclimate and habitats and reduce the soil disturbance
